The Process Model (1)

Lecture 3, Part 1: The Process Model Prof. Robert N. M. Watson

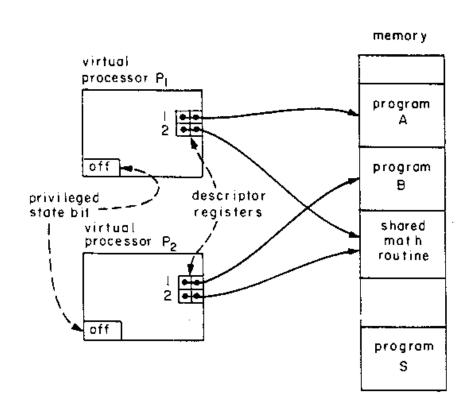

2023-2024

This time: The process model

- The process model and its evolution
- Brutal (re, pre)-introduction to VM
- Where do programs come from?

Lecture 3, Part 1
Lecture 3, Part 2

The Process Model: 1970s foundations

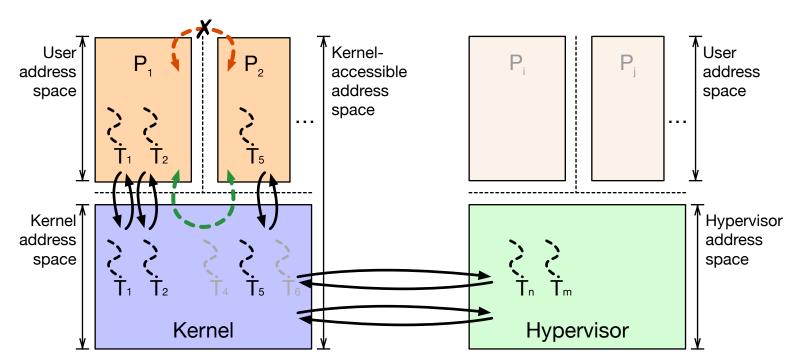

- Saltzer and Schroeder, The Protection of Information in Computer Systems, SOSP'73, October 1973. (CACM 1974)
- Multics process model
 - 'Program in execution'
 - Process isolation bridged by controlled communication via supervisor (kernel)
- Hardware foundations
 - Supervisor mode
 - Memory segmentation
 - Trap mechanism
- Hardware protection rings (Schroeder and Saltzer, 1972)

The process model: today - concept

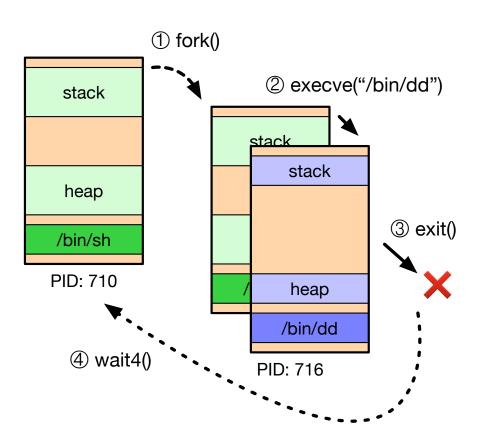

- 'Program in execution'
 - **Process** ≈ address space
 - Threads execute code
 - Unique instance of global variables, etc.
 - Isolated failure domain
- Unit of resource accounting
 - Open files, memory, ...
- Unit of privilege
 - Process credentials UID, OS privileges, MAC, RBAC, ...
 - NB: Increasing support for per-thread credentials
- Recently: Inverted App-OS trust model
 - Third-party applications cannot trust the OS ...
 - E.g., Trustzone, SGX, ...

The **process model** today: isolation and controlled communication

- Hardware foundations for isolation
 - Rings control MMU, I/O, etc.
 - MMU to construct mutually exclusive virtual address spaces
 - Context switched threads of control
- Hardware foundations for controlled communication
 - Interaction via traps: system calls, page faults, ...
 - MMU to construct shared memory

The UNIX process life cycle

• fork()

- Child inherits address space and other properties
- Program prepares process for new binary (e.g., stdio)
- Copy-on-Write (COW)

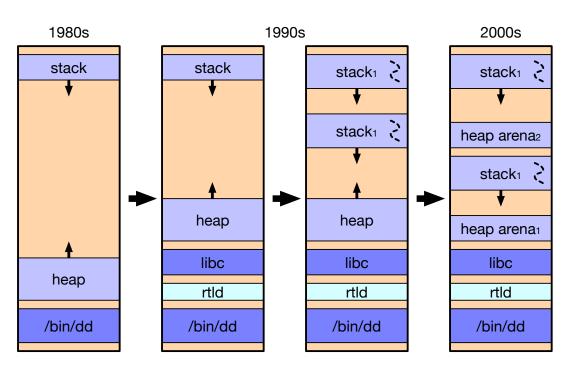

execve()

 Kernel replaces address space, loads new binary, starts execution

exit()

- Process can terminate self (or be terminated)
- wait4() (et al)
 - Parent can await exit status
- NB: posix_spawn()

Evolution of the process model

- 1980s: Code, heap, and stack
- 1990s: Dynamic linking, threading
- 2000s: Scalable memory allocators implement multiple arenas (e.g., as in jemalloc)
- Co-evolution with virtual memory (VM) research
 - Acetta, et al: Mach microkernel (1986)
 - Navarro, et al: Superpages (2002)
