$E' \rightarrow \dots$   
 $E' \rightarrow + T E'$   
 $E' \rightarrow \epsilon$   
 $\dots$

Table

...

Algorithm

Two actions

- matching** (if rhs starts with terminal)
- predicting** (if rhs has a nonterminal in front)

Analysis

Q: how do we predict a right-hand side? e.g. given

$$\begin{array}{l} A \rightarrow B \\ A \rightarrow C \end{array}$$

**Idea:** use the rest of the input (lookahead).

**Plan:** precompute all possible rhs for each nonterminal/terminal combination

Bottom-up

LL(k)

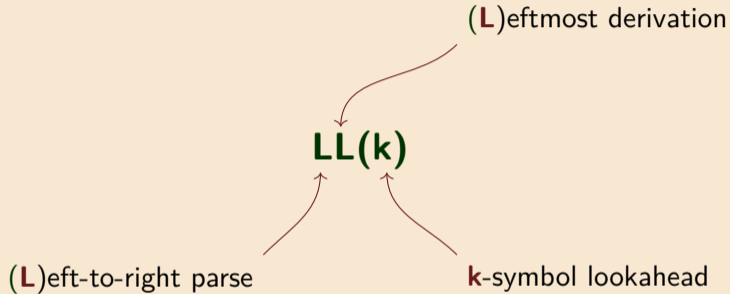

Derivations

Table

Algorithm

Analysis

Bottom-up

Looking at the next  $k$  tokens, an LL( $k$ ) parser **predicts** the next production. We will consider LL(1).

# For LL(1) add an end-of-input marker \$

LL(k)

Add an end-of-input marker \$:

$$G_3 = \langle N_3, T_3, P_3, E \rangle$$

$$G'_3 = \langle N'_3, T'_3, P'_3, \mathbf{S} \rangle$$

where

where

$$N_3 = \{E, E' T, T' F\}$$

$$N'_3 = \{E, E' T, T' F, \mathbf{S}\}$$

$$T_3 = \{+, *, (, ), id\}$$

$$T'_3 = \{+, *, (, ), id, \mathbf{\$}\}$$

$$\mathbf{S} \rightarrow \mathbf{E \$}$$

$$P_3 = \begin{array}{l} E \rightarrow T E' \\ E' \rightarrow + T E' \mid \epsilon \\ T \rightarrow F T' \\ T' \rightarrow * F T' \mid \epsilon \\ F \rightarrow (E) \mid id \end{array}$$

$$P'_3 = \begin{array}{l} E \rightarrow T E' \\ E' \rightarrow + T E' \mid \epsilon \\ T \rightarrow F T' \\ T' \rightarrow * F T' \mid \epsilon \\ F \rightarrow (E) \mid id \end{array}$$

How do we automate selection of the production to use at each step?

Building the table

LL(k)

The **FIRST set** for a sequence of symbols  $\alpha$  represents the terminals that may occur at the start of derivations of  $\alpha$  (and  $\epsilon$ , if  $\alpha \Rightarrow^* \epsilon$ )

$$\text{FIRST}(\alpha) = \{a \in T \mid \exists \beta \in (N \cup T)^*, \alpha \Rightarrow^* a\beta\} \cup \{\epsilon \mid \alpha \Rightarrow^* \epsilon\}$$

Table

We can compute FIRST for each nonterminal in a grammar (details later):

$S \rightarrow E\$$	$\text{FIRST}(S) = \{ (, id \}$
$E \rightarrow TE'$	$\text{FIRST}(E) = \{ (, id \}$
$E' \rightarrow +TE' \mid \epsilon$	$\text{FIRST}(E') = \{ +, \epsilon \}$
$T \rightarrow FT'$	$\text{FIRST}(T) = \{ (, id \}$
$T' \rightarrow *FT' \mid \epsilon$	$\text{FIRST}(T') = \{ *, \epsilon \}$
$F \rightarrow (E) \mid id$	$\text{FIRST}(F) = \{ (, id \}$

Algorithm

Analysis

Bottom-up

LL(k)

The **FOLLOW set** for a nonterminal  $A$  represents the terminals that may follow  $A$  in a derivation from the start symbol

$$\text{FOLLOW}(A) = \{a \mid \exists \alpha\beta, S \Rightarrow^+ \alpha A a \beta\}$$

Derivations

Table

We can compute FOLLOW for each nonterminal in a grammar (details later):

$S \rightarrow E \$$	
$E \rightarrow T E'$	$\text{FOLLOW}(E) = \{), \$\}$
$E' \rightarrow + T E' \mid \epsilon$	$\text{FOLLOW}(E') = \{), \$\}$
$T \rightarrow F T'$	$\text{FOLLOW}(T) = \{+, ), \$\}$
$T' \rightarrow * F T' \mid \epsilon$	$\text{FOLLOW}(T') = \{+, ), \$\}$
$F \rightarrow (E) \mid id$	$\text{FOLLOW}(F) = \{+, *, ), \$\}$

Q: is  $) \in \text{FOLLOW}(E)$ ?

Yes:  $S \Rightarrow E \$ \Rightarrow T E' \$ \Rightarrow F T' E' \$ \Rightarrow (E) T' E' \$$

Bottom-up

X	Y a	Y	Y
Y	$\epsilon$	$\epsilon$ c	$\epsilon$

Table M:

Algorithm

Analysis

There are multiple entries for  $M[S, d]$ . The grammar is **ambiguous**, and **not LL(1)**.

Bottom-up

# Bottom-up (LR) parsing is more powerful

LL(k)

Derivations

$$G_2 = \langle N_2, T_1, P_2, E \rangle$$

where

Table

$$P_2 = \begin{array}{l} E \rightarrow E + T \mid T \quad (\text{expressions}) \\ T \rightarrow T * F \mid F \quad (\text{terms}) \\ F \rightarrow (E) \mid id \quad (\text{factors}) \end{array}$$

Algorithm

Bottom-up parsing can process a wider class of grammars.

Analysis

With bottom-up parsing there is no need to eliminate left recursion.

Bottom-up

Next time: bottom-up parsing foundations
