Union bound
Problem setting

- Example problem: What is the probability of getting exactly 1 heads in 3 tosses of a fair coin?

- Prerequisites: set theory (language of sets).

- Many basic probability problems are counting problems.
Set theory

- $S$
- $L$
- $R$
- $L \cup R$
- $L \cap R$
- $L^c$
- $L - R$
Outline

Axioms

Union bound
What is counting?

- An experiment in probability: experiment $\rightarrow$ outcome

- Counting: How many possible outcomes can occur from performing this experiment?

- Can be generalised: 2 experiments, two outcomes, what is a joint outcome of 2 experiments?
Example of counting

Example

How many possible outcomes are there when rolling 1 die?

<table>
<thead>
<tr>
<th>Answer</th>
</tr>
</thead>
<tbody>
<tr>
<td>6 outcomes {1,2,3,4,5,6}</td>
</tr>
</tbody>
</table>
Example of counting

How many possible outcomes are there when rolling 1 die?

6 outcomes \{1,2,3,4,5,6\}

How many possible outcomes are there when rolling 2 dice?

36 outcomes \{(1,1), (1,2), \ldots, (1,6),
(2,1), (2,2), \ldots, (2,6),
\ldots,
(6,1), (6,2), \ldots, (6,6)\}
Generalising counting

- $r$ experiments
- experiment 1: $n_1$ outcomes

experiment 2: based on $n_1$ inputs has $n_2$ outcomes

experiment 3: based on combined outcome of experiment 1 and 2, so $n_1 \cdot n_2$ inputs has $n_3$ outcomes

... total of $n_1 \cdot n_2 \cdot \ldots \cdot n_r$ possible outcomes of $r$ experiments
Generalising counting

- $r$ experiments
- experiment 1: $n_1$ outcomes
- experiment 2: based on $n_1$ inputs has $n_2$ outcomes

... total of $n_1 \cdot n_2 \cdot \ldots \cdot n_r$ possible outcomes of $r$ experiments

University committee consists of 4 UGs, 5 PGs, 7 profs, 2 non-uni people. A subcommittee of 4, consisting of 1 person from each category, is to be chosen. How many different subcommittees are possible?

Answer
Example

University committee consists of 4 UGs, 5 PGs, 7 profs, 2 non-uni people. A subcommittee of 4, consisting of 1 person from each category, is to be chosen. How many different subcommittees are possible?

Answer

The choice of a subcommittee is the combined outcome of the 4 separate experiments of choosing a single representative from each of the categories. Thus: $4 \cdot 5 \cdot 7 \cdot 2 = 280$ possible subcommittees.
Sum rule

An experiment has either one of $m$ outcomes or one of $n$ outcomes, where none of the outcomes in both sets are the same. Then there are $m + n$ possible outcomes of the experiment.

Set definition of Sum rule

\[ |A| = m \quad \text{or} \quad |B| = n \quad \text{where} \quad A \cap B = \emptyset \]

then \# outcomes: \[ |A| + |B| = m + n \]
Sum rule

An experiment has either one of \( m \) outcomes or one of \( n \) outcomes, where none of the outcomes in both sets are the same. Then there are \( m + n \) possible outcomes of the experiment.

Set definition of Sum rule

\[
|A| = m \quad \text{or} \quad |B| = n \quad \text{where} \quad A \cap B = \emptyset
\]

then \# outcomes: \( |A| + |B| = m + n \)

Example

I can travel either to Italy to Rome, Naples, Milan, Venice and Florence, or to Spain to Madrid or Barcelona. How many cities can I travel to?

\[
|Italy| + |Spain| = 5 + 2 = 7
\]
Experiment has 2 parts. The first part results in one of \( m \) outcomes and the second in one of \( n \) outcomes regardless of the outcome of the first part. Then there are \( m \cdot n \) possible outcomes of the experiment.

\[
|A| = m \quad \text{and} \quad |B| = n \\
\text{then \# outcomes:} \quad |A| \cdot |B| = m \cdot n
\]
Experiment has 2 parts. The first part results in one of $m$ outcomes and the second in one of $n$ outcomes regardless of the outcome of the first part. Then there are $m \cdot n$ possible outcomes of the experiment.

Set definition of Product rule

$|A| = m$ and $|B| = n$
then $\# \text{ outcomes: } |A| \cdot |B| = m \cdot n$

Example

How many possible outcomes are there from rolling two 6-sided dice?

$|Dice_1| \cdot |Dice_2| = 6 \cdot 6 = 36$
The outcome of an experiment can be either from set $A$ or set $B$ where $A$ and $B$ may overlap.

**Generalised Sum rule**

$|A| = m$ or $|B| = n$ where it may be $A \cap B \neq \emptyset$

then #$\text{outcomes}: |A \cup B| = |A| + |B| - |A \cap B|$
Inclusion-exclusion

The outcome of an experiment can be either from set \( A \) or set \( B \) where \( A \) and \( B \) may overlap.

Generalised Sum rule

\[ |A| = m \quad \text{or} \quad |B| = n \quad \text{where it may be} \quad A \cap B \neq \emptyset \]

\text{then} \quad \# \text{ outcomes:} \quad |A \cup B| = |A| + |B| - |A \cap B| \]

Example

An 8-bit string is sent over a network. The receiver only accepts strings that either start with 01 or end with 10. How many 8-bit strings will the receiver accept?

\begin{align*}
\text{Answer} & \quad \underline{112}
\end{align*}
Inclusion-exclusion

The outcome of an experiment can be either from set $A$ or set $B$ where $A$ and $B$ may overlap.

**Generalised Sum rule**

$$|A| = m \quad \text{or} \quad |B| = n \quad \text{where it may be} \quad A \cap B \neq \emptyset$$

then \# outcomes: $$|A \cup B| = |A| + |B| - |A \cap B|$$

**Example**

An 8-bit string is sent over a network. The receiver only accepts strings that either start with 01 or end with 10. How many 8-bit strings will the receiver accept?

**Answer**

- strings starting with 01 in set $A$: 01?????? thus $|A| = 2^6 = 64$
- strings ending with 10 in set $B$: ???????10 thus $|B| = 2^6 = 64$
- overlapping strings $A \cap B$: 01?????10 thus $|A \cap B| = 2^4 = 16$
- total: $|A \cup B| = 64 + 64 - 16 = 112$
General principle of counting

Generalised Product rule

An experiment has $r$ parts such that part $i$ has $n_i$ outcomes for all $i = 1, \ldots, r$. Then the total number of outcomes for the experiment is:

$$\prod_{i=1}^{r} n_i = n_1 \cdot n_2 \cdots n_r$$

Non-personalised UK licence plates consist of 2 letters, 2 numbers followed by 3 letters. How many possible licence plates can be generated?

Answer

Each one of 7 places on the license plate is a separate event, where letters have 26 possibilities and numbers have 10 possibilities.

Total: $26 \cdot 26 \cdot 10 \cdot 10 \cdot 26 \cdot 26 = 1,188,137,600$
General principle of counting

Generalised Product rule

An experiment has \( r \) parts such that part \( i \) has \( n_i \) outcomes for all \( i = 1, \ldots, r \). Then the total number of outcomes for the experiment is:

\[
\prod_{i=1}^{r} n_i = n_1 \cdot n_2 \cdots n_r
\]

Example

Non-personalised UK licence plates consist of 2 letters, 2 numbers followed by 3 letters. How many possible licence plates can be generated?

Answer

\[
26 \cdot 26 \cdot 10 \cdot 10 \cdot 26 \cdot 26 \cdot 26 = 1,118,880,600
\]
General principle of counting

---

**Generalised Product rule**

An experiment has \( r \) parts such that part \( i \) has \( n_i \) outcomes for all \( i = 1, \ldots, r \). Then the total number of outcomes for the experiment is:

\[
\prod_{i=1}^{r} n_i = n_1 \cdot n_2 \cdot \cdots \cdot n_r
\]

---

**Example**

Non-personalised UK licence plates consist of 2 letters, 2 numbers followed by 3 letters. How many possible licence plates can be generated?

Answer

Each one of 7 places on the license plate is a separate event, where letters have 26 possibilities and numbers have 10 possibilities.

Total: \( 26 \cdot 26 \cdot 10 \cdot 10 \cdot 26 \cdot 26 \cdot 26 = 1,188,137,600 \)
Pigeonhole principle

If $m$ objects are placed into $n$ buckets, then at least one bucket has at least $\lceil \frac{m}{n} \rceil$ objects.

Reminder:
$\lceil X \rceil$: ceiling – smallest integer that is bigger than $X$
$\lfloor X \rfloor$: floor – largest integer that is smaller than $X$
**Pigeonhole principle**

If \( m \) objects are placed into \( n \) buckets, then at least one bucket has at least \( \lceil \frac{m}{n} \rceil \) objects.

Reminder:
\[
\lceil X \rceil: \text{ceiling – smallest integer that is bigger than } X \\
\lfloor X \rfloor: \text{floor – largest integer that is smaller than } X
\]

**Example**

10 pigeons are placed into 9 pigeonholes. How many pigeons are placed in any one pigeonhole at most?

Answer  

\[
\lceil \frac{10}{9} \rceil = 2
\]
Pigeonhole principle

If \( m \) objects are placed into \( n \) buckets, then at least one bucket has at least \( \lceil \frac{m}{n} \rceil \) objects.

Reminder:
\( \lceil X \rceil \): ceiling – smallest integer that is bigger than \( X \)
\( \lfloor X \rfloor \): floor – largest integer that is smaller than \( X \)

Example
10 pigeons are placed into 9 pigeonholes. How many pigeons are placed in any one pigeonhole at most?

At least one pigeonhole must contain \( \lceil \frac{m}{n} \rceil = 2 \) pigeons.

Set theory

Counting

Combinatorics

Probability space

Axioms

Union bound
Permutations

Permutation is a counting task of sorting $n$ objects. 

**Permutation rule (distinct)**

A permutation is an ordered arrangement of $n$ distinct objects. Then the number of ways in which these $n$ objects can be permuted (put into unique orderings) is:

$$n \cdot (n-1) \cdot (n-2) \cdots 2 \cdot 1 = n!$$
Permutation is a counting task of sorting $n$ objects.

**Permutation rule (distinct)**

A permutation is an ordered arrangement of $n$ distinct objects. Then the number of ways in which these $n$ objects can be permuted (put into unique orderings) is:

$$n \cdot (n - 1) \cdot (n - 2) \cdots 2 \cdot 1 = n!$$

**Example**

Consider the acronym CAM. How many different ordered arrangements of the letters C, A and M are possible?

Answer

$$\{(A, C, M), (A, M, C), (C, A, M), (C, M, A), (M, A, C), (M, C, A)\}$$, thus 6 possible permutations, i.e., $3! = 3 \cdot 2 \cdot 1$. 
Indistinct permutations

There are $n$ objects and $n_1$ are the same (indistinguishable), $n_2$ are the same, \ldots, $n_r$ are the same. Then the number of distinct permutations of these $n$ objects is:

$$\frac{n!}{n_1! \cdot n_2! \cdots n_r!}$$

Permutation of indistinct objects

How many distinct bit strings can be formed from two 0's and three 1's?

Answer

$$5! \cdot 2! \cdot 3! = 120 \cdot 2 = 10.$$
Indistinct permutations

Permutation of indistinct objects

There are \( n \) objects and \( n_1 \) are the same (indistinguishable), \( n_2 \) are the same, \ldots, \( n_r \) are the same. Then the number of distinct permutations of these \( n \) objects is:

\[
\frac{n!}{n_1! \cdot n_2! \cdots n_r!}
\]

Example

How many distinct bit strings can be formed from two 0’s and three 1’s?

Answer

\[
\frac{5!}{2! \cdot 3!} = \frac{120}{2 \cdot 6} = 10.
\]
A combination in an unordered selection of $r$ objects from a set of $n$ objects. If all objects are distinct, then the number of ways of making the selection is:

$$\frac{n!}{r!(n-r)!} = \binom{n}{r}$$

Reminder: note that $\binom{n}{r}$ is a binomial coefficient, read as “$n$ choose $r$”.

Example

Intro to Probability Combinatorics 18
A combination in an unordered selection of $r$ objects from a set of $n$ objects. If all objects are distinct, then the number of ways of making the selection is:

$$\frac{n!}{r!(n-r)!} = \binom{n}{r}$$

Reminder: note that $\binom{n}{r}$ is a binomial coefficient, read as “$n$ choose $r$.”
Combinations

A combination in an unordered selection of \( r \) objects from a set of \( n \) objects. If all objects are distinct, the number of ways of making the selection is:

\[
\frac{n!}{r!(n-r)!} = \binom{n}{r}
\]

select the first \( r \) in the permutation: 1 way, but the order is irrelevant thus \( r! \) ways to permute

permutations of all \( n \) objects

Example

Intro to Probability Combinatorics 18
A combination in an unordered selection of \( r \) objects from a set of \( n \) objects. If all objects are distinct, the number of ways of making the selection is:

\[
\frac{n!}{r!(n-r)!} = \binom{n}{r}
\]

- permutations of all \( n \) objects
- select the first \( r \) in the permutation: 1 way, but the order is irrelevant thus \( r! \) ways to permute
- \( (n-r)! \) ways to permute nonselected objects

Example: How many ways are there to select 3 unordered objects from a set of 7 objects?

\[
\binom{7}{3} = \frac{7!}{3!(7-3)!} = \frac{7!}{3!4!} = 35
\]
Combinations

A combination in an unordered selection of \( r \) objects from a set of \( n \) objects. If all objects are distinct, then the number of ways of making the selection is:

\[
\frac{n!}{r!(n - r)!} = \binom{n}{r}
\]

Reminder: note that \( \binom{n}{r} \) is a binomial coefficient, read as “\( n \) choose \( r \)”.

Example

How many ways are there to select 3 unordered objects from a set of 7 objects?

\[
\frac{n!}{r!(n - r)!} = \binom{7}{3} = \frac{7!}{3!4!} = 35
\]
Example of counting combinations

Example

How many ways are there to select 3 books from a set of 6 books, if there are two books that should not both be chosen together? For example, you are choosing 3 out of 6 probability books, but don’t want to choose both the 8th and 9th edition of the Ross textbook.

Answer

\[
\begin{align*}
\text{Case 1:} & \quad \text{Select 8th Ed and 2 other non-9th Ed} \quad 4 \choose 2 \\
\text{Case 2:} & \quad \text{Select 9th Ed and 2 other non-8th Ed} \quad 4 \choose 2 \\
\text{Case 3:} & \quad \text{Select 3 from books that are not 8th nor 9th Ed} \quad 4 \choose 3 \\
\text{Total:} & \quad \text{using Sum Rule of counting, we get} \quad 4 \choose 2 + 4 \choose 2 + 4 \choose 3 = 6 + 6 + 4 = 16.
\end{align*}
\]
Example of counting combinations

Example

How many ways are there to select 3 books from a set of 6 books, if there are two books that should not both be chosen together? For example, you are choosing 3 out of 6 probability books, but don’t want to choose both the 8th and 9th edition of the Ross textbook.

Case 1: Select 8th Ed and 2 other non-9th Ed – \( \binom{4}{2} \) ways to do so.

Answer

---

Case 2: Select 9th Ed and 2 other non-8th Ed – \( \binom{4}{2} \) ways to do so.

Case 3: Select 3 from books that are not 8th nor 9th Ed – \( \binom{4}{3} \) ways to do so.

Total: using Sum Rule of counting, we get \( \binom{4}{2} + \binom{4}{2} + \binom{4}{3} = 6 + 6 + 4 = 16. \)
Example of counting combinations

How many ways are there to select 3 books from a set of 6 books, if there are two books that should not both be chosen together? For example, you are choosing 3 out of 6 probability books, but don’t want to choose both the 8th and 9th edition of the Ross textbook.

Answer

\[ \text{Case 1: Select 8th Ed and 2 other non-9th Ed} - \binom{4}{2} \text{ ways to do so.} \]

\[ \text{Case 2: Select 9th Ed and 2 other non-8th Ed} - \binom{4}{2} \text{ ways to do so.} \]
Example of counting combinations

Example

How many ways are there to select 3 books from a set of 6 books, if there are two books that should not both be chosen together? For example, you are choosing 3 out of 6 probability books, but don’t want to choose both the 8th and 9th edition of the Ross textbook.

**Answer**

**Case 1:** Select 8th Ed and 2 other non-9th Ed – \( \binom{4}{2} \) ways to do so.

**Case 2:** Select 9th Ed and 2 other non-8th Ed – \( \binom{4}{2} \) ways to do so.

**Case 3:** Select 3 from books that are not 8th nor 9th Ed – \( \binom{4}{3} \) ways to do so.
Example of counting combinations

How many ways are there to select 3 books from a set of 6 books, if there are two books that should not both be chosen together? For example, you are choosing 3 out of 6 probability books, but don’t want to choose both the 8th and 9th edition of the Ross textbook.

Case 1: Select 8th Ed and 2 other non-9th Ed – \( \binom{4}{2} \) ways to do so.
Case 2: Select 9th Ed and 2 other non-8th Ed – \( \binom{4}{2} \) ways to do so.
Case 3: Select 3 from books that are not 8th nor 9th Ed – \( \binom{4}{3} \) ways to do so.

Total: using Sum Rule of counting, we get \( \binom{4}{2} + \binom{4}{2} + \binom{4}{3} = 6 + 6 + 4 = 16. \)
Multinomial combinations

If there are $n$ distinct objects, then the number of ways of selecting $r$ distinct groups of respective sizes $n_1, n_2, \ldots, n_r$ such that $\sum_{i=1}^{r} n_i = n$ is:

$$\frac{n!}{n_1!n_2! \cdots n_r!} = \binom{n}{n_1, n_2, \ldots, n_r}$$

where $\binom{n}{n_1, n_2, \ldots, n_r}$ is known as multinomial coefficient.
Multinomial combinations

If there are \( n \) distinct objects, then the number of ways of selecting \( r \) distinct groups of respective sizes \( n_1, n_2, \ldots, n_r \) such that \( \sum_{i=1}^{r} n_i = n \) is:

\[
\frac{n!}{n_1!n_2! \cdots n_r!} = \binom{n}{n_1, n_2, \ldots, n_r}
\]

where \( \binom{n}{n_1, n_2, \ldots, n_r} \) is known as multinomial coefficient.

Example

There are 13 children on the playground who need to be split into 3 groups of sizes 6, 4 and 3. How many different divisions are possible?

\[
\binom{13}{6, 4, 3} = \frac{13!}{6!4!3!} = 60060
\]
Examples

In order to organise a basketball tournament, 20 children at a playground divide themselves in 4 teams of 5 players. How many different divisions are possible?

Answer
In order to organise a basketball tournament, 20 children at a playground divide themselves in 4 teams of 5 players. How many different divisions are possible?

The answer is NOT \(^\binom{20}{5, 5, 5, 5}\) because the order of the four teams is irrelevant. It would be correct if being in team A were considered different from being in team D. But here we are only interested in the possible divisions, so since there are 4! permutations between team “labels”, the answer is

\[
\frac{\binom{20}{5, 5, 5, 5}}{4!} = \binom{20}{5, 5, 5, 5, 4}
\]
## Summary of combinatorics

### Counting tasks on $n$ objects (without replacement)

<table>
<thead>

**Useful identity:**

$$\left( \begin{array}{c} n \\ r \end{array} \right) = \left( \begin{array}{c} n-1 \\ r-1 \end{array} \right) + \left( \begin{array}{c} n-1 \\ r \end{array} \right)$$

where $1 \leq r \leq n$

**Binomial theorem:**

$$(x + y)^n = \sum_{r=0}^{n} \left( \begin{array}{c} n \\ r \end{array} \right) x^r y^{n-r}$$
Outline

Set theory

Counting

Combinatorics

Probability space

Axioms

Union bound
Random experiments

- Randomness is described by conducting experiments (or trials) with uncertain outcomes.

- **Sample space** $S$: a set of all possible outcomes of an experiment.

- **Event** $E$: some subset of $S$, i.e., $E \subseteq S$.

- Probability $P$ is a number between 0 and 1 to which we ascribe a meaning: our belief that an event $E$ occurs: $P[E] \in [0, 1]$. 
Sample spaces

The set of all possible outcomes of an experiment is called the sample space and is denoted by $S$. 

1. For the gender of a newborn child, the sample space is $S = \{G, B\}$.

2. For flipping two coins, the sample space is $S = \{(H, H), (H, T), (T, H), (T, T)\}$.

3. For rolling two dice, the sample space is $S = \{(i, j) : i, j \in \{1, 2, 3, 4, 5, 6\}\}$.

4. For YouTube hours in a day, the sample space is $S = \{x : x \in \mathbb{R}, 0 \leq x \leq 24\}$.
Sample spaces

Sample space

The set of all possible outcomes of an experiment is called the sample space and is denoted by $S$.

Examples

Give sample spaces for the following:
1. Gender of a newborn child
2. Flipping of 2 coins
3. Rolling 2 dice
4. YouTube hours in a day

Answer

1. $S = \{G, B\}$
2. $S = \{(H, H), (H, T), (T, H), (T, T)\}$
3. $S = \{(i, j) : i, j \in \{1, 2, 3, 4, 5, 6\}\}$
4. $S = \{x : x \in \mathbb{R}, 0 \leq x \leq 24\}$
Event spaces

An event space $E$ is some subset of $S$ that we ascribe meaning to: $E \subseteq S$. 

1. $E = \{G\}$
2. $E = \{(H, H), (H, T), (T, H)\}$
3. $E = \{(6,1), (6,2), (6,3), (6,4), (6,5), (6,6), (1,6), (2,6), (3,6), (4,6), (5,6)\}$
4. $E = \{x: x \in \mathbb{R}, 5 \leq x \leq 24\}$
Event spaces

An event space \( E \) is some subset of \( S \) that we ascribe meaning to:
\[ E \subseteq S. \]

Examples

Give event spaces for the following:

1. A newborn child is a girl.
   \[ E = \{ G \} \]

2. There is 1 or more heads on 2 coin flips.
   \[ E = \{ (H, H), (H, T), (T, H) \} \]

3. At least one of the numbers is a 6 in a rolling of 2 dice.
   \[ E = \{ (6,1),(6,2),(6,3),(6,4),(6,5),(6,6),(1,6),(2,6),(3,6),(4,6),(5,6) \} \]

4. Wasted day where 5 or more hours have been spent on YT.
   \[ E = \{ x : x \in \mathbb{R}, 5 \leq x \leq 24 \} \]
Set operations on events

Given event space $S$ and events $E$ and $F$:

**Union:** $E \cup F$ is the event containing all outcomes of $E$ or $F$.

$E = \{ (H, H), (H, T) \}$ and $F = \{ (H, T), (T, T) \}$ then
$E \cup F = \{ (H, H), (H, T), (T, T) \}$
Set operations on events

Given event space $S$ and events $E$ and $F$:

**Union:** $E \cup F$ is the event containing all outcomes of $E$ or $F$.
$E = \{(H, H), (H, T)\}$ and $F = \{(H, T), (T, T)\}$ then
$E \cup F = \{(H, H), (H, T), (T, T)\}$

**Intersection:** $E \cap F$ (also denoted $EF$) is the event containing all outcomes of $E$ and $F$.
$E = \{(H, H), (H, T)\}$ and $F = \{(H, T), (T, T)\}$ then
$E \cap F = EF = \{(H, T)\}$
Set operations on events

Given event space $S$ and events $E$ and $F$:

**Union:** $E \cup F$ is the event containing all outcomes of $E$ or $F$.
$E = \{(H, H), (H, T)\}$ and $F = \{(H, T), (T, T)\}$ then
$E \cup F = \{(H, H), (H, T), (T, T)\}$

**Intersection:** $E \cap F$ (also denoted $EF$) is the event containing all outcomes of $E$ and $F$.
$E = \{(H, H), (H, T)\}$ and $F = \{(H, T), (T, T)\}$ then
$E \cap F = EF = \{(H, T)\}$

**Complement:** $E^c$ is the event containing all outcomes in $S$ that are not in $E$.
Note, thus we have $E \cup E^c = S$ and $E \cap E^c = \emptyset$.
$S = \{(H, H), (H, T), (T, H), (T, T)\}$ and $E = \{(H, H), (H, T)\}$ then
$E^c = \{(T, H), (T, T)\}$
Set operations on events

Given event space $S$ and events $E$ and $F$:

**Union:** $E \cup F$ is the event containing all outcomes of $E$ or $F$.

$E = \{(H, H), (H, T)\}$ and $F = \{(H, T), (T, T)\}$ then

$E \cup F = \{(H, H), (H, T), (T, T)\}$

**Intersection:** $E \cap F$ (also denoted $EF$) is the event containing all outcomes of $E$ and $F$.

$E = \{(H, H), (H, T)\}$ and $F = \{(H, T), (T, T)\}$ then

$E \cap F = EF = \{(H, T)\}$

**Complement:** $E^c$ is the event containing all outcomes in $S$ that are not in $E$.

Note, thus we have $E \cup E^c = S$ and $E \cap E^c = \emptyset$.

$S = \{(H, H), (H, T), (T, H), (T, T)\}$ and $E = \{(H, H), (H, T)\}$ then

$E^c = \{(T, H), (T, T)\}$

The usual commutative, associative and distributive laws hold.

De Morgan’s laws: $(\bigcup_{i=1}^{n} E_i)^c = \bigcap_{i=1}^{n} E_i^c$ and $(\bigcap_{i=1}^{n} E_i)^c = \bigcup_{i=1}^{n} E_i^c$

Probability definition

Frequentist definition of probability

\[ P \left[ E \right] = \lim_{{n \to \infty}} \frac{n(E)}{n} \]

where \( n = \# \) of total trials and \( n(E) = \# \) trials where \( E \) occurs.

Interpretation of probability:

- Probability of desired event \( E \) is the ratio of the \# of trials that result in an outcome in \( E \) to the number of trials performed (in the limit as your number of trials approaches infinity).
- \( P \left[ E \right] \) is a measure of the chance of \( E \) occurring.
- Often probability is a measure of the individual’s degree of belief of \( E \) occurring (Bayesian definition).
- Interpretation is a mess, a philosophical argument.
- Choice of interpretation doesn’t matter, as long as the axioms of probability hold.
Axiom 1: For any event $E$, $0 \leq P[E] \leq 1$
Probability axioms

**Axiom 1:** For any event $E$, $0 \leq P[E] \leq 1$

**Axiom 2:** Probability of the sample space $S$ is $P[S] = 1$
**Axiom 1:** For any event $E$, $0 \leq P[E] \leq 1$

**Axiom 2:** Probability of the sample space $S$ is $P[S] = 1$

**Axiom 3:** If $E$ and $F$ are mutually exclusive ($E \cap F = \emptyset$), then 

$$P[E] + P[F] = P[E \cup F].$$

In general, for all mutually exclusive events $E_1, E_2, \ldots$

$$P \left[ \bigcup_{i=1}^{\infty} E_i \right] = \sum_{i=1}^{\infty} P[E_i]$$
Probability identities

Proposition 2: If $E \subseteq F$ then $P[E] \leq P[F]$

Proposition 4 (general inclusion-exclusion principle):

$$P \left[ \bigcup_{i=1}^{n} E_i \right] = \sum_{r=1}^{n} (-1)^{r+1} \sum_{1 \leq i_1 < i_2 < \cdots < i_r \leq n} P[E_{i_1} \cap \cdots \cap E_{i_r}]$$

(Proofs in book).

For sample space $S$ in which all outcomes are equally likely, we have $P[each \ outcome] = \frac{1}{|S|}$ and for any event $E \subseteq S$, $P[E] = \frac{|E|}{|S|}$. 

Probability with equally likely outcomes
Probability identities

Proposition 1: \( P \left[ E^c \right] = 1 - P \left[ E \right] = P \left[ S \right] - P \left[ E \right] \)

Proposition 2: If \( E \subseteq F \) then \( P \left[ E \right] \leq P \left[ F \right] \)
Probability identities

Proposition 1: $P \left[ E^c \right] = 1 - P \left[ E \right] = P \left[ S \right] - P \left[ E \right]$

Proposition 2: If $E \subseteq F$ then $P \left[ E \right] \leq P \left[ F \right]$

Proposition 3: $P \left[ E \cup F \right] = P \left[ E \right] + P \left[ F \right] - P \left[ EF \right]$

For sample space $S$ in which all outcomes are equally likely, we have $P \left[ \text{each outcome} \right] = \frac{1}{|S|}$ and for any event $E \subseteq S$, $P \left[ E \right] = \frac{\text{# outcomes in } E}{\text{# outcomes in } S} = \frac{|E|}{|S|}$
Probability identities

Proposition 1: $P\left[E^c\right] = 1 - P\left[E\right] = P\left[S\right] - P\left[E\right]$

Proposition 2: If $E \subseteq F$ then $P\left[E\right] \leq P\left[F\right]$

Proposition 3: $P\left[E \cup F\right] = P\left[E\right] + P\left[F\right] - P\left[EF\right]$

Proposition 4 (general inclusion-exclusion principle):

$$P\left[\bigcup_{i=1}^{n} E_i\right] = \sum_{r=1}^{n} (-1)^{r+1} \sum_{i_1<i_2<\cdots<i_r} P\left[E_{i_1} \cap \cdots \cap E_{i_r}\right]$$

(Proofs in book).
Probability identities

Proposition 2: If $E \subseteq F$ then $P[E] \leq P[F]

Proposition 4 (general inclusion-exclusion principle):

$$P\left[ \bigcup_{i=1}^{n} E_i \right] = \sum_{r=1}^{n} (-1)^{r+1} \sum_{i_1 < i_2 < \cdots < i_r} P[E_{i_1} \cap \cdots \cap E_{i_r}]$$

(Proofs in book).

Probability with equally likely outcomes

For sample space $S$ in which all outcomes are equally likely, we have

$P[\text{each outcome}] = \frac{1}{|S|}$ and for any event $E \subseteq S$,

$$P[E] = \frac{\# \text{ outcomes in } E}{\# \text{ outcomes in } S} = \frac{|E|}{|S|}$$
You order 2 dishes online with probability of 0.6 of liking the first dish, 0.4 of liking the second dish, and 0.3 of liking both dishes. What is the probability you will like neither dish?

$E_i$: event "you like dish $i$".

\[
P[\text{you will like neither dish}] = P[(E_1 \cup E_2)^c] = 1 - P[E_1 \cup E_2] = 1 - (P[E_1] + P[E_2] - P[E_1 \cap E_2]) = 1 - (0.6 + 0.4 - 0.3) = 0.3
\]
Examples

Example

3 people are randomly selected from a group of 11 people which is made of 5 women and 6 men. What is the probability that 2 women and 1 man are selected?

\[ S = \binom{11}{3} \] are all subsets of size 3 from 11 people. Random selection means each subset is equally likely. \( \binom{5}{2} \binom{6}{1} \) are all subsets with 2 women and 1 man.

\[
P[\text{2 women, 1 man}] = \frac{\binom{5}{2} \binom{6}{1}}{\binom{11}{3}} = \frac{4}{11}
\]
Birthday paradox

If \( n \) people are in a room, what is the probability that 2 have the same birthday? (Assume that there are 365 days and probability of being born on a given day is \( \frac{1}{365} \)).

Simpler to calculate probability that "no two people in the room have the same birthday" \( \left( = P \left[ E_n^c \right] \right) \) where \( E_n = "two \ people \ have \ birthday \ on \ the \ same \ day" \), and then use \( P \left[ E_n \right] = 1 - P \left[ E_n^c \right] \).

\[
|S| = 365^n
\]
\[
|E_n^c| = 365 \cdot 364 \cdots (365 - n + 1) \quad (# \ of \ ways \ to \ have \ no \ two \ people \ with \ the \ same \ bday)
\]
\[
P \left[ E_n^c \right] = \frac{365 \cdot 364 \cdots (365 - n + 1)}{365^n}
\]
\[
P \left[ E_n \right] = 1 - \frac{365 \cdot 364 \cdots (365 - n + 1)}{365^n} \quad (# \ of \ ways \ two \ people \ have \ the \ same \ bday)
\]

if \( n = 23 \) then \( P \left[ E_{23} \right] = 50.7\% \)

if \( n = 70 \) then \( P \left[ E_{70} \right] = 99.9\% \)
Outline

Set theory

Counting

Combinatorics

Probability space

Axioms

Union bound
For any events $E_1, E_2, \ldots, E_n$ we have

$$P \left[ \bigcup_{i=1}^{n} E_i \right] \leq \sum_{i=1}^{n} P \left[ E_i \right]$$

For $E_1$ and $E_2$ it is easy to see:

$$P \left[ E_1 \cup E_2 \right] = P \left[ E_1 \right] + P \left[ E_2 \right] - P \left[ E_1 \cap E_2 \right] \leq P \left[ E_1 \right] + P \left[ E_2 \right].$$

Useful in applications that need to show that the probability of union for some events is less than some value.

E.g., in random graphs that are used to analyse social networks, wireless networks, the internet: given nodes and edges with associated probabilities, what is the probability that there exists an isolated node in the graph that is not connected to any other nodes in the graph.
Summary of probability problems

- Find the sample space $S$.
- Define events of interest $E$.
- Determine outcome probabilities.
- Compute event probabilities.
