\LaTeX{} – a document formatter

\LaTeX{}: a macro package for the TeX ($\tau\epsilon\chi$, "tech") typesetting system

- excellent facilities for mathematical notation
- de-facto standard for preparing scientific publications in mathematical, physical, computing and engineering disciplines

**History:** Donald Knuth (Stanford CS) developed TeX in mid 1970s, in SAIL, to typeset his “Art of Computer Programming” books, reimplemented it in Pascal in the mid 1980s (WEB, literate programming), was later ported to C. Leslie Lamport (SRI, DEC) wrote L\LaTeX{} in early 1980s. Both now community maintained as TeX Live open-source distribution.

Classic processing steps:

- \texttt{latex} $\rightarrow$ \texttt{dvi}
- \texttt{dvips} $\rightarrow$ \texttt{ps}$\rightarrow$ \texttt{pdf}

Modern alternative:

- \texttt{pdflatex} $\rightarrow$ \texttt{pdf}
- \texttt{pdf}\texttt{latex}

These slides: prepared using the \LaTeX{} beamer class.

\LaTeX{} – features and benefits

- Most popular mathematical typesetting language (subset imitations now also in: Word, MathJax, MediaWiki, etc.)
- Encourages logical markup $\Rightarrow$ helps to maintain consistent style
- Plain-text source $\Rightarrow$ easy to collaborate via version-control systems
- Command-line tool $\Rightarrow$ easy to automate build (make)
- Use any plain-text editor you like (Emacs, vi, TeXworks, Word, etc.)
- Robust for large, complex documents (PhD thesis, books, etc.)
- Highly extensible (a Turing-complete macro programming language)
  $\Rightarrow$ vast collection of add-on packages for special typesetting needs (figures, logic proofs, pseudo code, circuit diagrams, flow charts, chemical formulae, slides, chess positions, etc.)

\begin{verbatim}
\usepackage{skaknew}
\usepackage{skak}
\usepackage{stmaryrd}
\usepackage{amsmath}
\usepackage{amssymb}
\usepackage{tikz-cd}
\end{verbatim}

- Computer Modern, etc. $\Rightarrow$ free font families
- Mature, free, portable, open source, used by many science publishers
\documentclass[12pt]{article}
\setlength{\textwidth}{75mm}
\begin{document}
\title{\TeX -- a summary}
\author{Markus G. Kuhn}
\date{5 October 2023}
\maketitle
\thispagestyle{empty}

\section{Introduction}
Mathematical formulæ such as $e^{i\pi} = -1$ or even
\begin{equation}
\Phi(z) = \frac{1}{\sqrt{2\pi}} \int_0^x e^{-\frac{1}{2} x^2}
\end{equation}
were a real `pain' to typeset until Knuth's text formatter \TeX became available \cite{Knuth86}.

\bibitem{Knuth86} Donald E. Knuth: The \TeX book. Addison-Wesley, 1986.
\end{thebibliography}
\end{document}

\TeX – a summary
Markus G. Kuhn
5 October 2023

1 Introduction
Mathematical formulæ such as $e^{i\pi} = -1$ or even
\begin{equation}
\Phi(z) = \frac{1}{\sqrt{2\pi}} \int_0^x e^{-\frac{1}{2} x^2}
\end{equation}
were a real ‘pain’ to typeset until Knuth’s text formatter \TeX became available \cite{Knuth86}.

References
\cite{Knuth86} Donald E. Knuth: The \TeXbook. Addison-Wesley, 1986.

\TeX works GUI IDE

\TeX works is a \LaTeX editor that shows source text and PDF output side by side and makes it easy to navigate between them:

There are even Web-based \TeX editors, e.g. overleaf.com, papeeria.com, latexbase.com

\TeX input syntax

\begin{itemize}
\item \TeX reads plain-text *.tex files (e.g., prepared with emacs)
\item no distinction is made between space character and line feed
\item multiple spaces are treated like a single space
\item empty lines act as paragraph separator (just like the \texttt{\par} command)
\item command, macro and variable names start with a backslash (\), followed by either a sequence of letters or a single non-letter character (uppercase/lowercase is significant).
\begin{itemize}
\item Correct: \texttt{\par}, \texttt{\item}, \texttt{\pagethree}, \LaTeX, \texttt{+/}, \texttt{\333}, \texttt{\333}
\item Wrong: \texttt{\page33}, \texttt{\333}
\end{itemize}
\item space and line-feed characters are ignored if they follow a command/macro-variable name consisting of letters. Use \texttt{\_} to add an explicit space (e.g., \LaTeX syntax ⇒ \TeX syntax).
\end{itemize}

Characters with special semantics

In *.tex input files, the following are meta characters (part of syntax):
\begin{itemize}
\item # \$ \% \& \_ \^ \{ \}
\end{itemize}

#\$%&\_\^\{\} can be included in regular text using the macros
\begin{itemize}
\item \# \$ \% \& \_ \^ \{ \}
\end{itemize}

Otherwise:
\begin{itemize}
\item % starts a comment
\item # macro parameter
\item \$ delimits inline equations
\item \& tabulator mark
\item \_ line separator
\item \_ superscript
\item \_ subscript (in math mode)
\item \{ begin group
\item \} end group
\end{itemize}

Comments: All characters between (and including) a % and the next line feed will be ignored. Append % at the end of a line to avoid interpretation of the subsequent line feed as a space.

One could also insert \texttt{\_} and \texttt{\^} as \texttt{\textbackslash\textbackslash\texttt{\_} and \texttt{\textbackslash\textbackslash\texttt{\^}}. But this is rarely ever done. The ASCII characters \texttt{\_} are not typically used in regular text. They are common in computing-related strings (identifiers, source code, path names, URLs, etc.), for which it is customary to use a fixed-width typewriter font. There use the \texttt{verbatim} environment or the macro \texttt{\verb+...+}, which typeset all ASCII characters in typewriter font, or \texttt{\url{...}} for URLs.
Typewriting versus typesetting

The ASCII (ISO 646) 7-bit character set has only 94 graphic characters:

```
!”#$%&’()*+,-./0123456789:;<=>?@
ABCDEFGHIJKLMNOPQRSTUVWXYZ[\]^_`abcdedefghijklmnopqrstuvwxyz{|}~
```

They were chosen to cover the character repertoire of US typewriters and teletype printers. The standards committee added a few more symbols ({|}_) in the hope that they will be useful for programming.

\TeX defines a number of shortcuts and macros to access the much larger set of "typographic" characters used by book printers.

These typographic \TeX commands still cannot be found on standard PC keyboard layouts, which were designed for 7-bit ASCII.
Dashes

ASCII provides only a single combined hyphen-minus character, but typesetters distinguish carefully between several dash characters:

<table>
<thead>
<tr>
<th>Dashes</th>
<th>Unicode</th>
</tr>
</thead>
<tbody>
<tr>
<td>−</td>
<td>U+002D</td>
</tr>
<tr>
<td>--</td>
<td>U+2013</td>
</tr>
<tr>
<td>---</td>
<td>U+2014</td>
</tr>
<tr>
<td>$-$</td>
<td>U+2212</td>
</tr>
</tbody>
</table>

The hyphen (−) is the shortest of these and is used to combine separate words or split words across line-breaks.

The en dash (–) is often used to denote a range of numbers (as in pages 64–128), or—as in this example—as a punctuation dash.

The em dash is used—like this—as a punctuation dash, often without surrounding space, especially in US typography.

The minus (−) is a mathematical operator, whose shape matches the plus (+), unlike the hyphen or dashes. Compare: -+, −+, −−+, −−−.

Non-ASCII Symbols

<table>
<thead>
<tr>
<th>Symbols</th>
<th>ASCII</th>
<th>Latin</th>
<th>Escape</th>
</tr>
</thead>
<tbody>
<tr>
<td>¡</td>
<td>¡</td>
<td>A</td>
<td>\AA</td>
</tr>
<tr>
<td>¿</td>
<td>?</td>
<td>o</td>
<td>\o</td>
</tr>
<tr>
<td>Ñ</td>
<td>ø</td>
<td>oe</td>
<td>\oe</td>
</tr>
<tr>
<td>ÑÆ</td>
<td>Æ</td>
<td>Æ</td>
<td>\AE</td>
</tr>
<tr>
<td>å</td>
<td>å</td>
<td>aa</td>
<td>\aa</td>
</tr>
</tbody>
</table>

With \usepackage[utf8]{inputenc} such characters can also be entered as UTF-8 Unicode.

Combining characters

<table>
<thead>
<tr>
<th>\d{o}</th>
<th>\ö</th>
<th>\ö</th>
<th>\o</th>
</tr>
</thead>
<tbody>
<tr>
<td>ñ</td>
<td>ó</td>
<td>ó</td>
<td>ó</td>
</tr>
<tr>
<td>ñ</td>
<td>ó</td>
<td>ó</td>
<td>ó</td>
</tr>
<tr>
<td>ñ</td>
<td>ñ</td>
<td>ñ</td>
<td>ñ</td>
</tr>
<tr>
<td>ñ</td>
<td>ñ</td>
<td>ñ</td>
<td>ñ</td>
</tr>
</tbody>
</table>

Quotation marks

Typewriters and ASCII offer only unidirectional ‘single’ and “double” quotation marks, while typesetters use ‘curly’ and “directed” variants.

\TeX{} input files use the single quotation mark (‘) and the grave accent (‘) to encode these, as well the mathematical ‘prime’ marker and the French accents:

<table>
<thead>
<tr>
<th>Quotation</th>
<th>Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>‘</td>
<td>U+2018</td>
</tr>
<tr>
<td>‘</td>
<td>U+2019</td>
</tr>
<tr>
<td>“</td>
<td>U+201C</td>
</tr>
<tr>
<td>”</td>
<td>U+201D</td>
</tr>
<tr>
<td>$’$</td>
<td>U+2032</td>
</tr>
<tr>
<td>‘\u</td>
<td>U+00B4</td>
</tr>
<tr>
<td>‘\u</td>
<td>U+00B5</td>
</tr>
</tbody>
</table>

The apostrophe (it’s) is identical to the right single quotation mark.

In some older terminal fonts (especially of US origin), the ‘ and ‘ characters have a compromise shape somewhere between the quotation marks ‘‘ and the accents ‘‘.

Space – the final frontier

Traditional English typesetting inserts a larger space at the end of a sentence. \TeX{} believes any space after a period terminates a sentence, unless it is preceded by an uppercase letter. Parenthesis are ignored.

This works often: J. F. Kennedy’s U.S. budget. Look!

But not always: E.g. NASA. Dr. K. Smith et al. agree.

To correct failures of this heuristic, use

<table>
<thead>
<tr>
<th>Space</th>
<th>Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>−</td>
<td>no-break space</td>
</tr>
<tr>
<td>\␣</td>
<td>force normal space</td>
</tr>
<tr>
<td>@</td>
<td>following punctuation ends sentence</td>
</tr>
</tbody>
</table>

as in

E.g. NASA\@. Dr.”K. Smith et al.\ agree.

Or disable the distinction of spaces with \frenchspacing.
Structure of a \LaTeX{} document

First select a document class and its options, e.g. with
\begin{verbatim}
\documentclass[12pt,a4paper]{article}
\end{verbatim}

Standard classes: \texttt{article}, \texttt{report}, \texttt{book}, \texttt{letter}, \texttt{slides}.

Publishers often provide authors with their own class as a \texttt{*cls} file. Appendix A of \textit{The \LaTeX{} Companion} explains how to write new class files. A popular class for presentation slides: \texttt{beamer}.

Environment: group delimited by \texttt{\begin{name}} and \texttt{\end{name}}, e.g.
\begin{verbatim}
\begin{document}
...
\end{document}
\end{verbatim}

Common environments: \texttt{abstract}, \texttt{center}, \texttt{verbatim}, \texttt{itemize}, \texttt{enumerate}, \texttt{quote}, \texttt{tabular}, \texttt{equation}, ...

Mark headings with
\begin{verbatim}
\section{...} \subsection{...} \paragraph{...}
\end{verbatim}

and \LaTeX{} will take care of font sizes, numbering, and table of contents.

Verbatim text: quoting source code

\textbf{Lines of source code}: the \texttt{verbatim} environment disables all meta characters, uses a typewriter font and preserves space and line feed:
\begin{verbatim}
\begin{verbatim}
$initial = substr($record->{'name'}, 0, 1);
\end{verbatim}
\end{verbatim}

Do not indent a verbatim block (prints all whitespace). Keep \texttt{\end{verbatim}} on its own line.

\textbf{Source code with math mode}: \texttt{alltt} \texttt{\usepackage{alltt}} is similar to verbatim, but keeps the meta characters \texttt{\{}, so you can still switch fonts and typeset mathematical expressions:
\begin{verbatim}
\begin{alltt}
for \(i := 1,\ldots,n\)
print \(x[i, 2]\)
\end{alltt}
\end{verbatim}

\textbf{Inline strings}: use \texttt{\verb+text+} to quote text inside a paragraph, where + is any character that does not occur in text. This also disables meta characters, preserves whitespace, and switches to a typewriter font.

\begin{verbatim}
for \(i := 1,\ldots,n\)
print \(x[ab(i), sp(2)]\)
\end{verbatim}

You can’t use \texttt{\verb} in command arguments, use \texttt{\texttt{text}} there instead. The \texttt{\verb+text+} variant prints spaces as \texttt{\texttt{␣}}. Fix single quotation mark: \texttt{\usepackage{upquote}}.

\LaTeX{} list environments

\begin{verbatim}
\begin{itemize}
\item Mammals
  \begin{itemize}
  \item Dogs
  \item Ponys
  \end{itemize}
\item Insects
\item[+] ... 
\end{itemize}
\begin{enumerate}
\setcounter{enumi}{-1}
\item Fruits
  \begin{enumerate}
  \item Apples
  \item Cucumbers\label{c}
  \end{enumerate}
\item Veggies
  (see also \ref{c})
\item ... 
\end{enumerate}
\end{verbatim}

\begin{verbatim}
0. Fruits
(a) Apples
(b) Cucumbers
1. Veggies (see also 0b)
2. ... 
\end{verbatim}

\texttt{Package} \texttt{enumitem} adds many configuration options to these environments. (\texdoc{enumitem})

Tweaking and extending \LaTeX{}

\LaTeX{} behaviour can be changed by overwriting predefined variables and macros. This can be done

\begin{itemize}
\item ▶ in the \texttt{preamble} (between the \texttt{\documentclass{. . .}} and \texttt{\begin{document}} lines) ⇒ for the entire document
\item ▶ anywhere in the document ⇒ the effect will last only until the end of the current group (i.e., the next \texttt{\}} or \texttt{\end{. . .}})
\end{itemize}

\textbf{Packages}

A huge collection of extension packages exists for \LaTeX{}. Some merely define additional macros and environments, others rewrite parts of \LaTeX{}’s internal machinery. For example, adding to the preamble
\begin{verbatim}
\usepackage{hyperref}
\end{verbatim}

loads all the macros and settings defined in the \texttt{hyperref.sty} package. \texttt{hyperref} adds new macros, such as \texttt{\url{. . .}} for typesetting URLs, but also automatically turns every reference to a page, section, or bibliographic entry into a hyperlink.

\textbf{Documentation}: \texdoc{packagename} e.g. \texdoc{geometry}
Example: changing page layout geometry

Adjust margins manually, via numerous length variables:
\setlength{\oddsidemargin}{-0.4mm} % 25 mm left margin
\setlength{\evensidemargin}{\oddsidemargin}
\setlength{\textwidth}{160mm} % 25 mm right margin
\setlength{\topmargin}{-5.4mm} % 20 mm top margin
\setlength{\headheight}{5mm}
\setlength{\headsep}{5mm}
\setlength{\footskip}{10mm}
\setlength{\textheight}{237mm} % 20 mm bottom margin

More comfortable:
\usepackage[vmargin=20mm,hmargin=25mm]{geometry}
The \texttt{geometry.sty} package automatically recalculates any dimensions not specified.

Make paragraphs not indented at the first line, but spaced apart slightly:
\setlength{\parindent}{0mm}
\setlength{\parskip}{\medskipamount}
Or just:
\usepackage{parskip}

Mathematical typesetting

In \TeX{}, mathematical formulas are formatted in a completely different mode from that used for normal text.

Inline formulas such as $a_n$ ($\$a\_n\$) that appear as part of a normal paragraph have to be surrounded with $\ldots$ or 
\( \ldots \), while \[ \ldots \] produces a displayed formula, such as

$$F_n = F_{n-1} + F_{n-2} \quad \{ F_n = F_{n-1} + F_{n-2} \}$$

In math mode

\begin{itemize}
  \item space characters are ignored; \TeX{} adds its own space around operators based on heuristics; manually add thinspace with \texttt{\textbackslash,}.
  \item a special \texttt{math italic} font is used, with different inter-character spacing, designed for \texttt{single-letter variables} concatenated in products
  \item many additional macros for special symbols are defined
\end{itemize}

Math italic is very \texttt{different} and not suitable for writing words or units!

Use \texttt{\textbackslash mathrm{\ldots}} around words, as in $v_{\texttt{diff}}$.

Macros for common function symbols (constants: upright font!):
\[
\max_{x\in\mathbb{R}}\{\log_2(\cos x)\}
\]

Macros for neatly aligning multiple equations: \texttt{\usepackage{amsmath}}, see \texttt{texdoc amsldoc}.

24
Mathematical symbols

Relations

\leq, \geq, \approx, \equiv, \ll, \gg, \subset, \subseteq, \bowtie, \in, \vdash, \smile, \frown, \sqsubseteq, \ni, \dashv, |, \parallel, \Join

\not<, \not=, \not\leq, \not\prec, \not\succ, \not\equiv, \not\ll, \not\gg, \not\subset, \not\subseteq, \not\bowtie, \not\in, \not\vdash, \not\smile, \not\frown, \not\sqsubseteq, \not\ni, \not\dashv, \not|, \not\parallel, \not\Join

Arrows

\leftarrow, \Leftarrow, \rightarrow, \Rightarrow, \leftrightarrow, \Leftrightarrow, \mapsto, \hookleftarrow, \leftharpoonup, \leftharpoondown, \rightleftharpoons, \longleftarrow, \Longrightarrow, \longleftrightarrow

\Longleftrightarrow, \longmapsto, \hookrightarrow, \rightharpoonup, \rightharpoondown, \leadsto, \nearrow, \searrow, \swarrow, \nwarrow, \uparrow, \downarrow, \Uparrow, \Downarrow, \updownarrow, \Updownarrow, \nearrow, \searrow, \swarrow, \nwarrow

Large operators and delimiters

\sum, \prod, \coprod, \int, \oint, \bigcap, \bigcup, \bigodot, \bigotimes, \bigoplus, \biguplus, \bigvee, \bigwedge

These appear smaller inline than in displayed equations: \( \prod_{i=0}^{n-1} \) vs \( \prod_{0}^{n-1} \)

[ \lbrack \rbrack, \lfloor \rfloor, \langle \rangle, \lbrace \rbrace, \langle\langle \rangle\rangle, \\backslash \left( \right) \]

Use \ldots in a, b, \ldots, z, but \cdots in a + b + \cdots + z. Never write ...

Use \ldots in a, b, \ldots, z, but \cdots in a + b + \cdots + z. Never write ...

\left( \sum_{i=0}^{\infty} x^i \right) \left( \sum_{i=0}^{\infty} x^{i} \right)
Mathematical symbols

Alternative names
\ne \neq \le \to \ge \gets \owns \land \lor \lnot \\verticalbar \Vert

Stacking things

\begin{array}{cc}
  a^b & a_{b} \\
  a-b & \overline{a-b} \\
  a-b & \underline{a-b} \\
  a-b & \underbrace{a-b}_c \\
\end{array}

= \left \{ \begin{array}{cl}
a^{2^{2^2}}, & a \ge 0 \\
-\frac{1}{a}, & a < 0 \\
\end{array} \right .

Postscript/PDF graphics facilities

Applying coordinate transforms:
The graphicx package provides access to the geometric transform capabilities of the PostScript and PDF languages:

\scalebox{0.8}{
\begin{array}{c}
\includegraphics{diagram.pdf} \\
\includegraphics{screen.png} \\
\includegraphics{photo.jpg} \\
\includegraphics[width=0.6\linewidth]{photo.jpg} \\
\includegraphics{190mm}{60mm}{becomes 19 cm $\times$ 6 cm large} \\
\includegraphics[width=0.6\linewidth]{photo.jpg} \\
\end{array} \}

Changing colours:
The color package also uses Postscript/PDF special commands:

This text is \textcolor{red}{printed in red} if ...

This text is \textcolor{red}{printed in red} if you include \usepackage{color}.

Default: \definecolor{red}{rgb}{1,0,0}

Including graphics

DVI only supports characters and filled rectangles, but dvips and pdftex also understand embedded "special" instructions that provide more.

Embedded PostScript (EPS) vector graphics:
Normal PostScript files (*.ps) produce a sequence of pages. An EPS file describes only an image and is meant to be included into a PostScript page. EPS files lack instructions to output paper, but define a rectangular "bounding box", using special \%BoundingBox comments.

Load the graphicx extension of L\_ATEX by adding

\usepackage{graphicx}

to the preamble. Then write

\includegraphics{filename.eps}

wherever you want to include the graphics file into your text.

In pdflatex, the graphicx package allows you to include graphics from PDF (vector graphics), JPEG (photos) and PNG (bitmap) files:

\includegraphics{filename.pdf}

Figures and references

Larger figures interfere with page breaking. They are best placed into a figure environment, such that \LaTeX can move them around. Example:

\begin{figure}
\includegraphics[width=0.6\linewidth]{photo.jpg} \\
\caption{This photograph shows the experimental setup.} \\
\label{fig:expsetup}
\end{figure}

The automatically assigned figure number can be quoted as in:

See also Figure~\ref{fig:expsetup} (page~\pageref{fig:expsetup}).

The \label{...} command can also be used after \section{...}, \subsection{...}, etc. and inside \begin{equation} ... \end{equation} to assign symbolic names to section and equation numbers, which can then be resolved via \ref{...} or \pageref{...}.

No need to manually renumber figures, sections, or equations!
Build tools for \LaTeX

To make sure \verb|\label| references and tables of contents use the correct numbers, it may be necessary to call \texttt{latex} twice. It will output “Rerun to get cross-references right” in this case.

The following implicit Makefile rule takes care of this:

```makefile
%.pdf %.aux %.idx: %.tex
  pdflatex $<
  while grep 'Rerun to get ' $*.log ; do pdflatex $< ; done
```

An alternative is the "\texttt{latexmk}" tool, which automatically determines dependencies (e.g. from \texttt{\includegraphics}) and recompiles \LaTeX documents where file modification timestamps indicate that this is necessary.

Graphics editor \texttt{xfig}

- Its *.fig files have a simple plain-text format that can be edited manually, script generated, and leads to useful diffs.
- Can export *.eps or *.pdf files
- Can also produce figures in which \LaTeX is used to fill in all the text. This provides math mode, macros, symbols, references, fonts that match the main text, etc.

Ask \texttt{xfig} to export a *.pse – *.pse_t file pair. The *.pse file lacks the text parts of the figure. The *.pse_t file contains \LaTeX commands that first load the *.pse image, and then add all the text in the figure. Select the “special text” mode in \texttt{xfig} to enable \LaTeX metacharacters. Use \texttt{\usepackage{*.pse_t}} to add such a figure in your document. (PDF equivalent: *.pdftex – *.pdftex_t)

- Command-line export tool (e.g., for Makefile): \texttt{fig2dev}

```makefile
%.eps: %.fig
  fig2dev -L eps $< $@
%.pstex %.pstex_t: %.fig
  fig2dev -L pstex_t -p $*.pstex $< $*.pse_t
  fig2dev -L pstex $< $*.pse
%.pdftex %.pdftex_t: %.fig
  fig2dev -L pdftex_t -p $*.pdftex $< $*.pdftex_t
  fig2dev -L pdftex $< $*.pdftex
```

Other graphics tools: TikZ, \texttt{pmmtops}, Inkscape, MATLAB, R, gnuplot, Python+matplotlib

Bibliographic references

Academic writing: detailed references to prior work

- to support arguments
- to document familiarity with the field
- to help newcomers to the field
- to give due academic credit
- to join the bibliometric graph of the field (recommendation systems)
- to trigger notifications to cited authors (e.g. Google Scholar alerts)

A bibliographic reference needs to contain all information needed to help readers (and increasingly search engines!) to unambiguously identify and locate the text referred to. Minimum: First two authors, full title, date, indication of type of publication (usually implicitly via other details).

Inter-library loan required many details: names and location of publishers or the volume, issue and page numbers in printed journals. Today, most readers retrieve scientific publications (with the exception of books) digitally, so online identifiers such as URIs or DOIs are more important instead.

Many URLs (e.g., to author’s home pages, “grey literature”) do not last long, but can still later be retrieved via archival services (e.g., archive.org). Therefore: accompany URLs with the date on which you accessed them. Try to HTTP redirect your own URLs when moving web space.

Bibliographic references – styles

Four widely used styles:

- **short-title** – most common in books on humanities, e.g. "Hart, Hart’s Rules, p. 52"
- **author-date** – most common in science and social science, e.g. “Goossens (1997)” or “(Goossens, 1997b)”.
- **author-number** – follows the name of the author(s) with a per-author number (rare with \LaTeX), e.g. “Goossens (2)”
- **number-only** – all publications sequentially numbered in bibliography, made popular by \LaTeX, now very widely used in computer science, e.g. “[67]”.

Collect full references at the end of the document (bibliography), each chapter, or page of first mention (footnotes).

With number-only bibliography: for important work, include author(s) name and year in first mention in the text. Avoid abusing numerical references like a noun (bad: “as shown by [17]”, nice: “as Knuth showed in 1988 [17]”).

When referencing books, also include a chapter or page number.
Bibliographic references – manual approach

\LaTeX\ can also manage numerical references to a bibliography.

Append near the end of your document (usually after conclusions and before appendices) your list of bibliographic items, assigning each an alphanumeric identifier:

\begin{thebibliography}{9}
\end{thebibliography}

Then refer to these in the text using \cite:

Finer details on the use of en-dashes are explained by Lamport\cite{Lamport94} or Dupre\cite{Dup98}.
\cite can take an optional note in [], e.g. for a page or section number.
\bibitem can take an optional label in {}.
\begin{thebibliography}{99} needs a "widest label" as an argument to plan indentation.

Example \*.bib file entry

@TechReport{UCAM-CL-TR-123,
  author = {Herbert, John},
  title = {Case Study of the {Cambridge Fast Ring ECL} Chip using \text{HOL}},
  year = 1988,
  month = feb,
  institution = {University of Cambridge, Computer Laboratory},
  number = {UCAM-CL-TR-123}
}

Important: Many U.S. publishers’ house styles use “title case” for publication titles, where most words (other than short articles and prepositions) start with a capital letter.

This form of emphasis is not appropriate for bibliographic references, therefore many Bib\TeX\ styles convert titles to lowercase.

Protect names (proper nouns) and acronyms in titles from automatic lowercase-ification by surrounding them with {...}.

Title case: Case Study of the Cambridge Fast Ring ECL Chip using HOL
Sentence case: Case study of the Cambridge Fast Ring ECL chip using HOL
Bad-Bib\TeX\ case: Case study of the cambridge fast ring ecl chip using hol

Automatic compilation of references with Bib\TeX

Consider using Bib\TeX\ if you

\begin{itemize}
  \item expect to write several publications, sharing many references, each formatted to different house styles;
  \item want number-only references sorted in order of first reference;
  \item want automatic author-year references (use package natbib)
  \item want to use a reference database
\end{itemize}

Provide \*.bib bibliographic database files and a \*.bst bibliographic style file (often provided by publisher). Load these as in

\begin{verbatim}
\bibliography{articles,group-refs}
\bibliographystyle{unsrt}
\end{verbatim}

Details:
Lamport, Section 4.3 and Appendix B. \LaTeX\ Companion, Chapter 12.

Exercise 1: Copy file example.tex from slide 9, run “pdflatex example” twice (why?), and then “okular example.pdf &” (Linux) to see the output.

Exercise 2: Read pages 1–64 of the \LaTeX\ book, then write your CV with \LaTeX, convert the result into PDF, and put it onto your homepage.

For information on how to set up homepages locally: https://www.srcf.net/

Exercise 3: In a job interview for a position as a subeditor of a technical journal, your skills in spotting typographic mistakes made by \LaTeX\ beginners are tested with this example text:

\begin{verbatim}
The \(-7\) dB loss \((\pm\,2\,\text{dB})\) shown on pp. 7-9 can be attributed to the \(f(t)=\sin(2\pi ft)\) signal, where \(t\) is the the time and \(f=48\text{KHz}\) is the "sampling frequency".
\end{verbatim}

Can you spot all 14 mistakes? Write down both the probable original incorrect \LaTeX\ source text, as well as a corrected version.
