Outline

Recap: Weak Law of Large Numbers

Central Limit Theorem

Illustrations

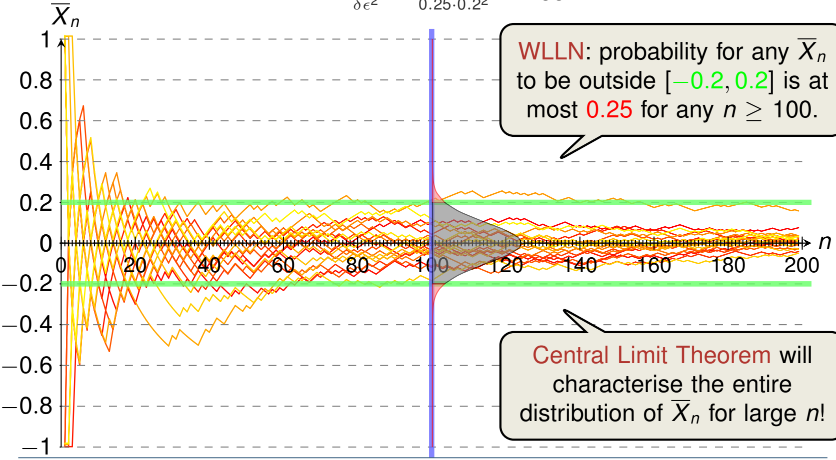
Examples

Weak Law of Large Numbers (4/4)

Weak Law of Large Numbers: For any $\epsilon > 0$, $\lim_{n\to\infty} \mathbf{P}\left[\,|\overline{X}_n - \mu| > \epsilon\,\right] = 0$

$$\Rightarrow \quad \epsilon = 0.2, \delta = 0.25, \exists N\colon \forall n \geq N\colon \mathbf{P}\left[\,|\overline{X}_n - \mu| > 0.2\,\right] \leq 0.25$$

$$N = \frac{\sigma^2}{\delta\epsilon^2} = \frac{1}{0.25 \cdot 0.2^2} = 100$$



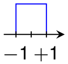
WLLN: probability for any $\overline{X}_n$ to be outside $[-0.2, 0.2]$ is at most 0.25 for any $n \geq 100$.

Central Limit Theorem will characterise the entire distribution of $\overline{X}_n$ for large n!

Outline

Towards the CLT: Finding the Right Scaling

- Let $X_1, X_2, \ldots$ i.i.d. with $\mu = 0$ and finite σ^2

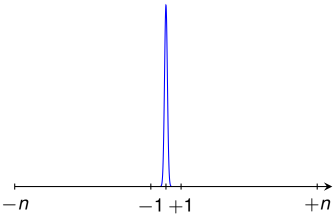


The Sum

- Let $\widetilde{X}_n := \sum_{i=1}^{n} X_i$ (often denoted by S_n)
- The variance is $\mathbf{V}\left[\widetilde{X}_n\right] = n\sigma^2 \to \infty$

The Sample Average (Sample Mean)

- Let $\overline{X}_n := \frac{1}{n} \cdot \sum_{i=1}^{n} X_i$
- The variance is $\mathbf{V}\left[\overline{X}_n\right] = \sigma^2/n \to 0$



The Proper Scaling (Standardising, see Lec. 5)

- Let $Z_n := \frac{1}{\sqrt{n} \cdot \sigma} \cdot \sum_{i=1}^{n} X_i$
- The variance is $\mathbf{V}\left[\,Z_n\,\right] = 1$

Central Limit Theorem

A. de Moivre (1667-1754)

P.-S. de Laplace (1749-1827)

C. Gauss (1777-1855)

A. Lyapunov (1857-1918)

C. Lindeberg (1876-1932)

Central Limit Theorem

Let $X_1, X_2, \ldots$ be any sequence of independent identically distributed random variables with finite expectation μ and finite variance σ^2. Let

$$Z_n := \sqrt{n} \cdot \frac{\overline{X}_n - \mu}{\sigma} = \frac{1}{\sqrt{n} \cdot \sigma} \cdot \left(\sum_{i=1}^{n} X_i - n \cdot \mu \right)$$

Then for any number $a \in \mathbb{R}$, it holds that

$$\lim_{n \to \infty} F_{Z_n}(a) = \Phi(a) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{a} e^{-x^2/2} dx,$$

where Φ is the distribution function of the $\mathcal{N}(0,1)$ distribution.

In words: the distribution of Z_n **always** converges to the distribution function Φ of the standard normal distribution.

Comments on the CLT

- one of the most remarkable results in probability/statistics
- extremely useful tool in data analysis or physical measurements
  - we may not know the actual distribution in real-world, and CLT says we don't have to(!)
  - adding up independent noises in measurements leads to an error following the Normal distribution
  - applies also to sums of random variables which may be unbounded

- catch: the CLT only holds **approximately**, i.e., for large n

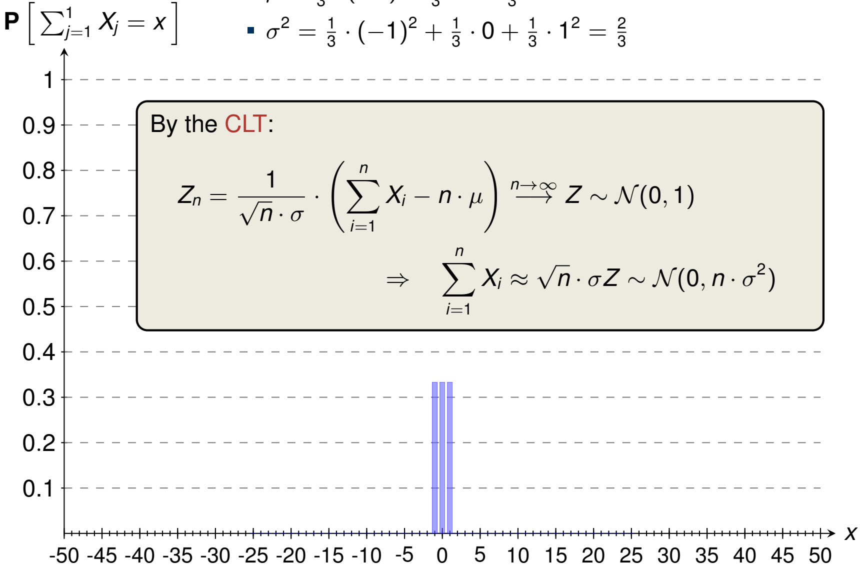
When is the approximation good?

- usually $n \geq 10$ or $n \geq 15$ is sufficient in practice
- approximation tends to be worse when threshold a is far from 0, distribution of X_i's asymmetric, bimodal or discrete
- (for a result quantifying the approximation error: Berry-Esseen-Theorem)

Outline

Illustration of CLT (1/4)

- $\mu = \frac{1}{3} \cdot (-1) + \frac{1}{3} \cdot 0 + \frac{1}{3} \cdot 1 = 0$
- $\sigma^2 = \frac{1}{3} \cdot (-1)^2 + \frac{1}{3} \cdot 0 + \frac{1}{3} \cdot 1^2 = \frac{2}{3}$



By the CLT:

$$Z_n = \frac{1}{\sqrt{n} \cdot \sigma} \cdot \left(\sum_{i=1}^{n} X_i - n \cdot \mu \right) \xrightarrow{n \to \infty} Z \sim \mathcal{N}(0,1)$$

$$\Rightarrow \quad \sum_{i=1}^{n} X_i \approx \sqrt{n} \cdot \sigma Z \sim \mathcal{N}(0, n \cdot \sigma^2)$$

Illustration of CLT (1/4)

- $\mu = \frac{1}{3} \cdot (-1) + \frac{1}{3} \cdot 0 + \frac{1}{3} \cdot 1 = 0$
- $\sigma^2 = \frac{1}{3} \cdot (-1)^2 + \frac{1}{3} \cdot 0 + \frac{1}{3} \cdot 1^2 = \frac{2}{3}$

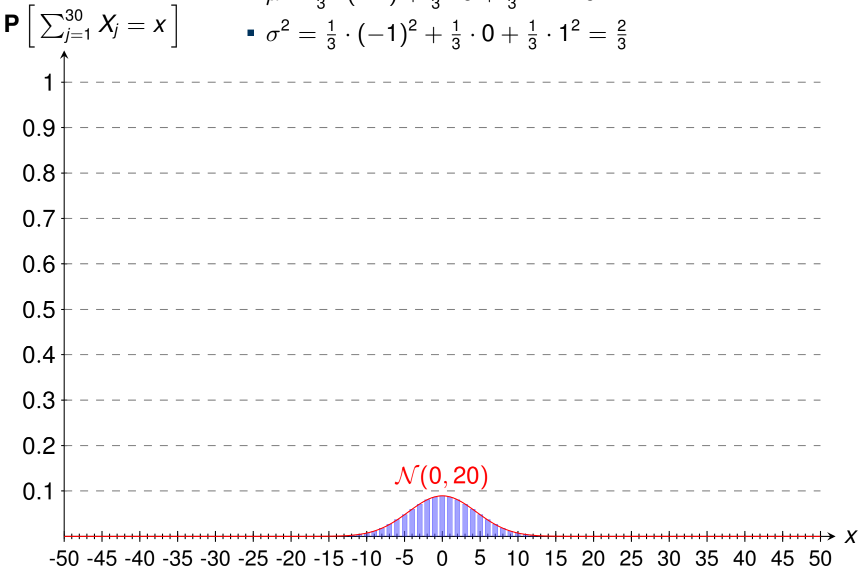


Illustration of CLT (2/4)

- $\mu = 0.15 \cdot (-3) + 0.1 \cdot (-2) + 0.05 \cdot (-1) + 0.7 \cdot 1 = 0$
- $\sigma^2 = 0.15 \cdot 9 + 0.1 \cdot 4 + 0.05 \cdot 1 + 0.7 \cdot 1 = 2.5$

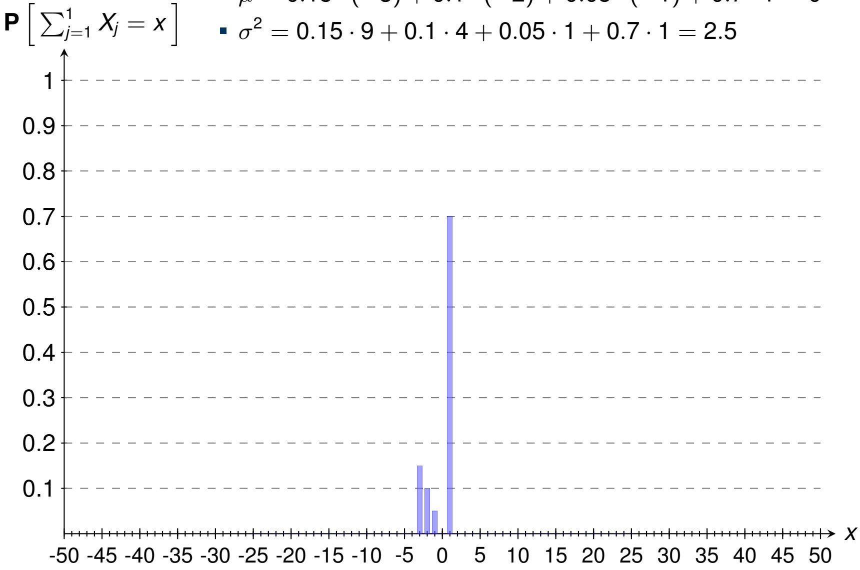

Illustration of CLT (2/4)

- $\mu = 0.15 \cdot (-3) + 0.1 \cdot (-2) + 0.05 \cdot (-1) + 0.7 \cdot 1 = 0$
- $\sigma^2 = 0.15 \cdot 9 + 0.1 \cdot 4 + 0.05 \cdot 1 + 0.7 \cdot 1 = 2.5$

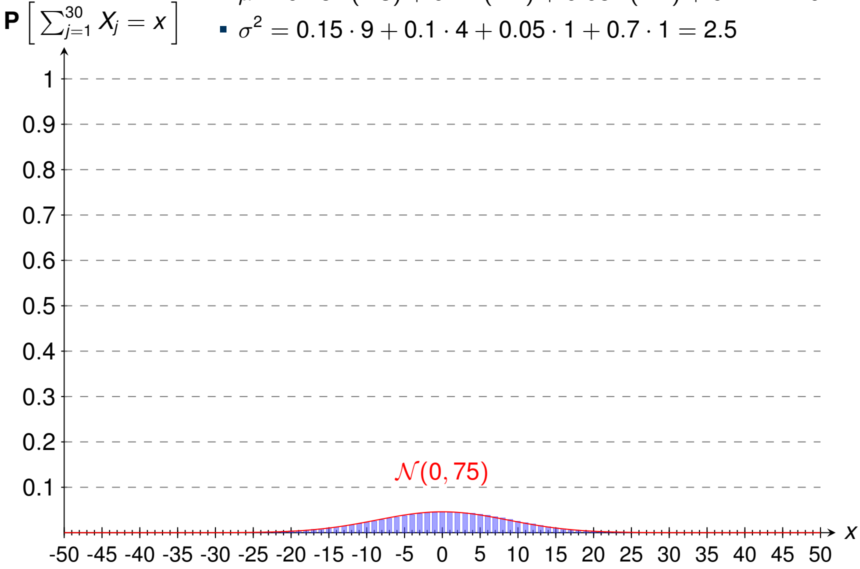

Illustration of CLT (3, Part I) (Distribution from Lecture 8)

- $\mu = \frac{1}{2} \cdot (-1) + \frac{1}{2} \cdot 1 = 0$
- $\sigma^2 = \frac{1}{2} \cdot (-1)^2 + \frac{1}{2} \cdot 1^2 = 1$

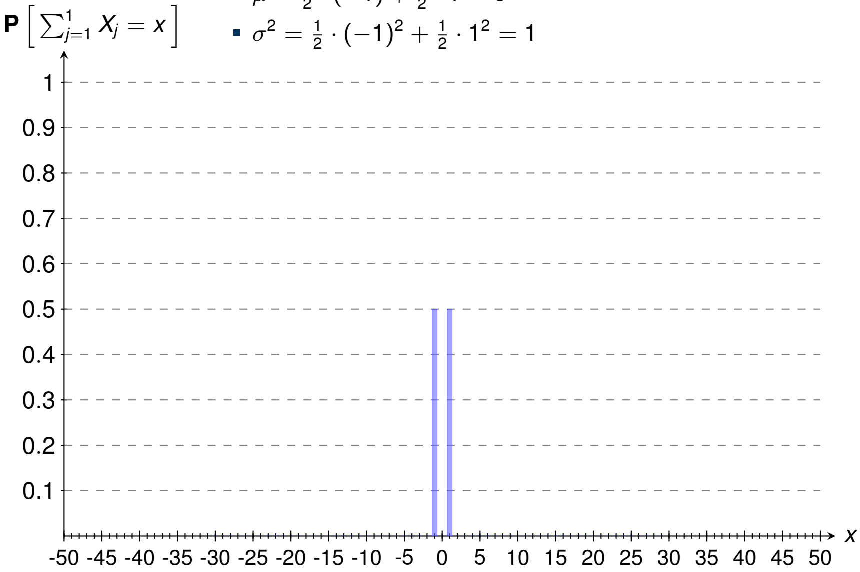

Illustration of CLT (3, Part I) (Distribution from Lecture 8)

- $\mu = \frac{1}{2} \cdot (-1) + \frac{1}{2} \cdot 1 = 0$
- $\sigma^2 = \frac{1}{2} \cdot (-1)^2 + \frac{1}{2} \cdot 1^2 = 1$

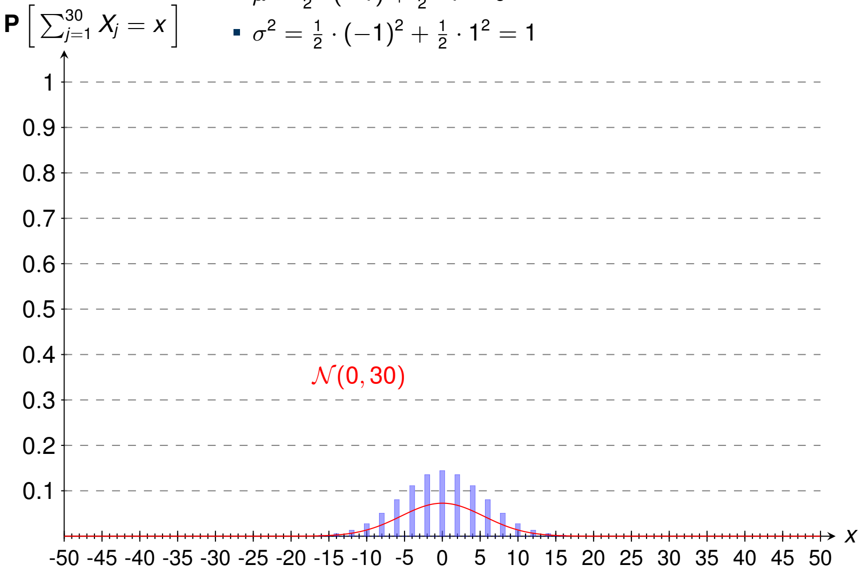

Illustration of CLT (3, Part I) (Distribution from Lecture 8)

- $\mu = \frac{1}{2} \cdot (-1) + \frac{1}{2} \cdot 1 = 0$
- $\sigma^2 = \frac{1}{2} \cdot (-1)^2 + \frac{1}{2} \cdot 1^2 = 1$

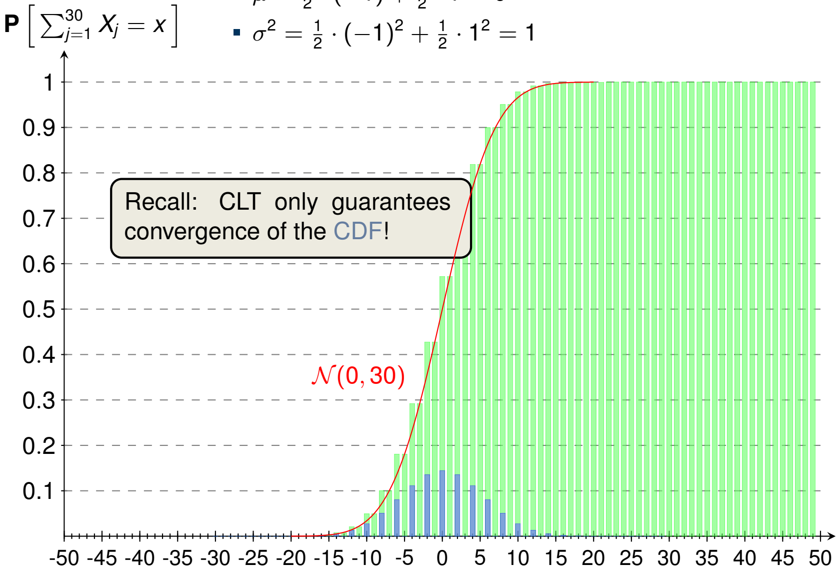

Illustration of CLT (3, Part II) (Distribution from Lecture 8)

- $\mu = \frac{1}{2} \cdot (-1) + \frac{1}{2} \cdot 1 = 0$
- $\sigma^2 = \frac{1}{2} \cdot (-1)^2 + \frac{1}{2} \cdot 1^2 = 1$

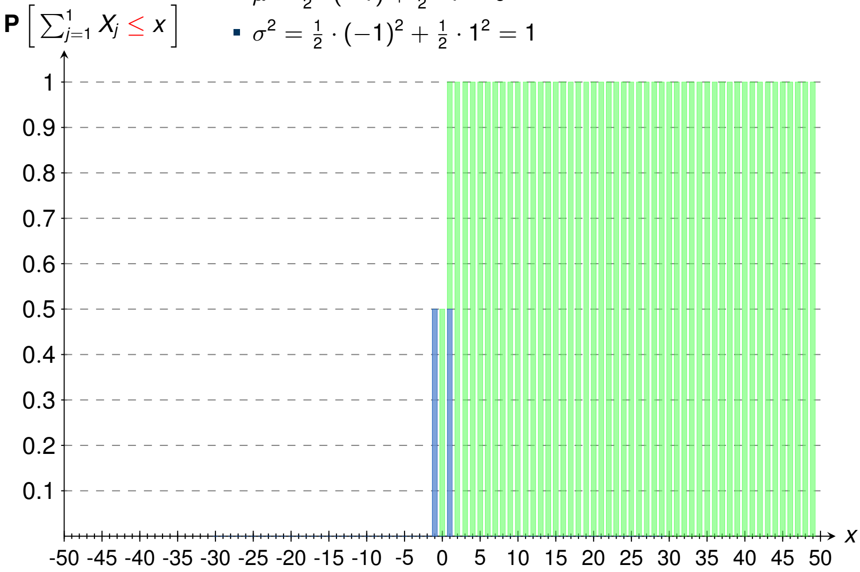

Illustration of CLT (3, Part II) (Distribution from Lecture 8)

- $\mu = \frac{1}{2} \cdot (-1) + \frac{1}{2} \cdot 1 = 0$
- $\sigma^2 = \frac{1}{2} \cdot (-1)^2 + \frac{1}{2} \cdot 1^2 = 1$

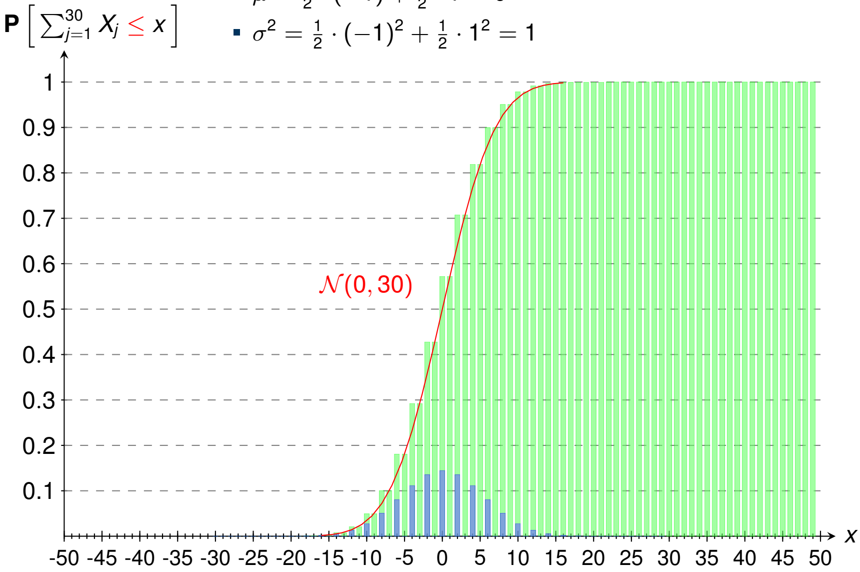

Illustration of CLT (4, Part I) with Standardising

Please see the full slides for the illustration!

- $\mu = \frac{1}{3} \cdot (-1) + \frac{1}{3} \cdot 0 + \frac{1}{3} \cdot 1 = 0$
- $\sigma^2 = \frac{1}{3} \cdot (-1)^2 + \frac{1}{3} \cdot 0^2 + \frac{1}{3} \cdot 1^2 = \frac{2}{3}$

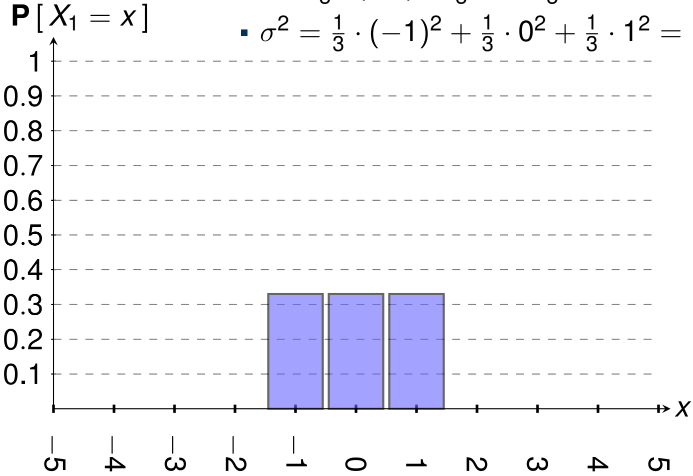

Illustration of CLT (4, Part II) with Standardising

Question: What if we need $\Phi(x)$ for negative x?

$$Z \sim \mathcal{N}(0,1) \qquad \mathbf{P}[Z \leq x] = \Phi(x)$$

Due to symmetry of density we have $\Phi(x) = 1 - \Phi(-x)$.

Normal Approximation of the Binomial Distribution

Example 1

Suppose you are attending a multiple-choice exam of 10 questions and you are completely unprepared. Each question has 4 choices, and you are going to pass the exam if you guess at least 6 correct answers. Use the normal approximation to estimate the probability of passing.

Answer

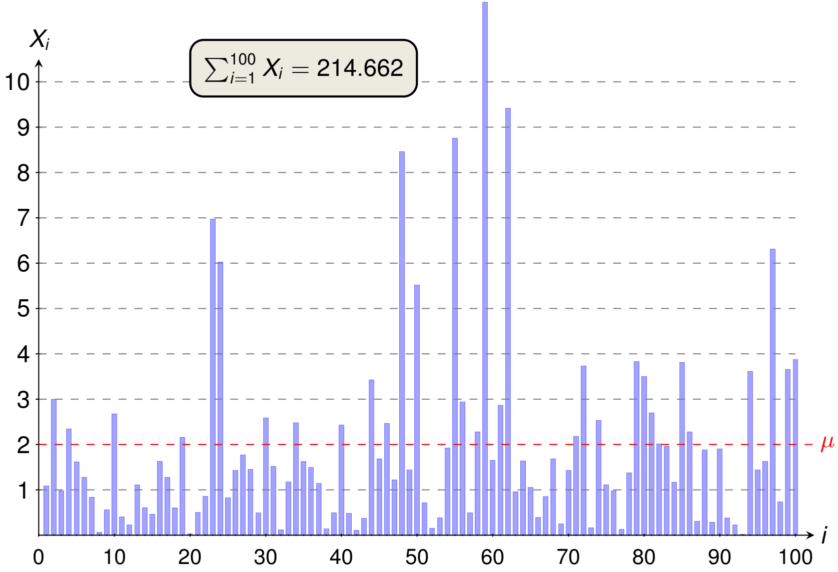
A "Reverse" Application of the CLT

Example 2

Suppose we are sequentially loading one container with packets, whose weights are i.i.d. exponential variables with parameter $\lambda = 1/2$. The container has a capacity of 100 weight units. How many packets can we load so that we meet the capacity threshold with at least .95 probability?

Answer

A Sample of 100 Exponential Random Variables $Exp(1/2)$



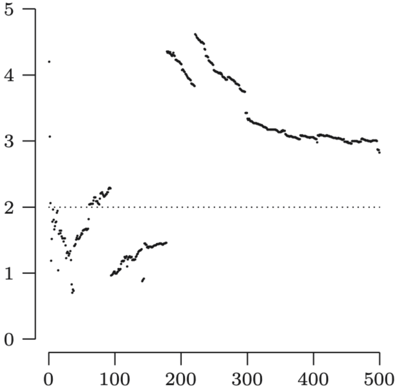
Comparison between Markov, Chebyshev and CLT

Example 3

Consider $n = 100$ independent coin flips. Estimate the probability that the number of heads is greater or equal than 75.

Answer

A Distribution whose Average does not converge



Cau$(2, 1)$ distribution, Source: Dekking et al., Modern Introduction to Statistics

The Cauchy distribution has "too heavy" tails (no expectation), in particular the average does not converge.
