

# Lecture 3: Goal-oriented interaction

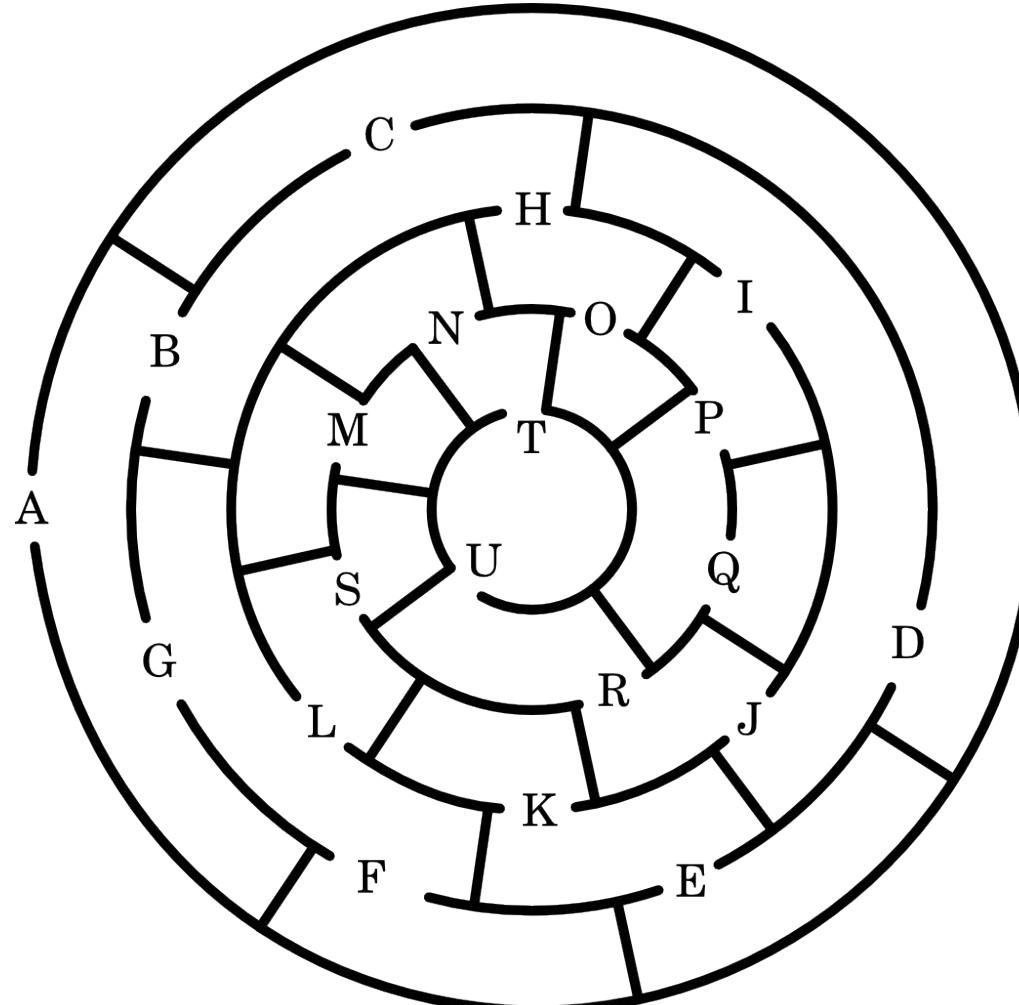

Using cognitive theories of planning, learning and understanding to understand user behaviour, and what they find hard.

# Overview of the course

- Theory driven approaches to HCI
- Design of visual displays
- **Goal-oriented interaction**
- Designing efficient systems
- Designing smart systems (guest lecturer)
- Designing meaningful systems (guest lecturer)
- Evaluating interactive system designs
- Designing complex systems

**A *Metatheory* (in first-wave HCI):  
User interaction can be modelled as  
search**

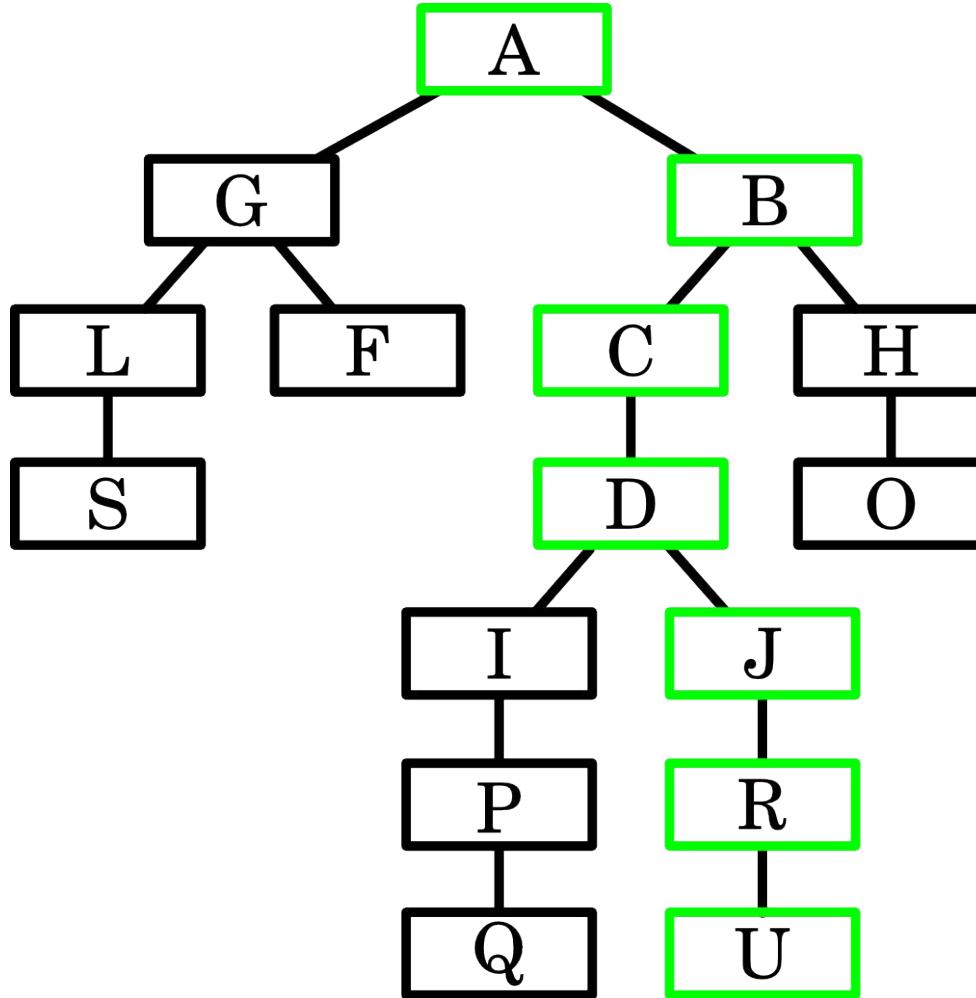

To come in Prolog course (later this term):  
problem solving using graph search

From Rice &  
Beresford

# Turn the problem into a graph

# Encode as Prolog facts to solve

route(a,g).

route(g,l).

route(l,s).

...

travel(A,A).

travel(A,C) :- route(A,B),travel(B,C).

start(a).

finish(u).

solve :- start(A),finish(B), travel(A,B).

**HCI example of a User Goal:**  
“How much did my use of Google  
Cloud Platform cost me last month?”

### Why Google Cloud Platform?

The image shows the Google Cloud Platform (GCP) dashboard. A red arrow points to the 'Billing' link in the left sidebar, which is currently selected. The sidebar also includes links for Home, Compute Engine, App Engine, Datastore, Storage, Cloud Launcher, API & Services, Support, IAM & admin, Getting started, App Engine, Compute Engine, Kubernetes Engine, Cloud Functions, and Storage. The main dashboard area displays 'Project info', 'App Engine' (Summary count/sec), 'Compute Engine' (CPU %), and 'Cloud Storage' (2 buckets). The right sidebar features sections for Google Cloud Platform status (All services normal), Billing (Estimated charges USD \$93.12 for Jan 1 - 12, 2018), Error Reporting (No application errors in the last 24 hours), and News (Stateful and ML workloads now run better on Google Kubernetes Engine with the latest version 1.9, 3 hours ago; Three ways to configure robust firewall rules, 6 hours ago; Why you should pick strong consistency, whenever possible, 1 day ago).

What search algorithm is being used here?

Breadth first/Depth first?

# Click targets

The screenshot shows the Google Cloud Platform homepage. Several UI elements are highlighted with red circles:

- The "CONSOLE" button in the top navigation bar.
- The "CONTACT SALES" button in the top navigation bar.
- The "CONTACT SALES" button on the main landing page.
- The "LEARN MORE" button under the "Forrester Research" section.
- The "LEARN MORE" button under the "GCP Region Expansion" section.
- The "LEARN MORE" button under the "Let's Talk About AI" section.

The page content includes:

- A main headline: "Build What's Next Better software. Faster."
- A list of benefits:
  - ✓ Use Google's core infrastructure, data analytics and machine learning.
  - ✓ Secure and fully featured for all enterprises.
  - ✓ Committed to open source and industry leading price-performance.
- Call-to-action buttons: "GO TO CONSOLE" and "CONTACT SALES".
- Section highlights: "Forrester Research", "GCP Region Expansion", and "Let's Talk About AI".
- A large "Why Google Cloud Platform?" section at the bottom.

# Click targets

The screenshot shows the Google Cloud Platform (GCP) dashboard. The left sidebar lists various services and products, many of which are highlighted with red circles. The main dashboard area shows project info, App Engine, Compute Engine, and Trace metrics, along with a Getting Started section. The right sidebar contains news and other service status information, also with some red circles highlighting specific links.

**Left Sidebar (Highlighted Elements):**

- Compute Engine
- App Engine
- Datastore
- Storage
- Cloud Launcher
- Billing
- APIs & Services
- Support
- IAM & admin
- Getting started
- App Engine
- Compute Engine
- Kubernetes Engine
- Cloud Functions
- Bigtable

**Main Dashboard (Highlighted Elements):**

- Go to project settings
- Go to the App Engine dashboard
- Go to latency overview
- Go to the Compute Engine dashboard

**Right Sidebar (Highlighted Elements):**

- Go to Cloud status dashboard
- View detailed charges
- Go to Error Reporting

**Google Cloud Platform status:**  
All services normal

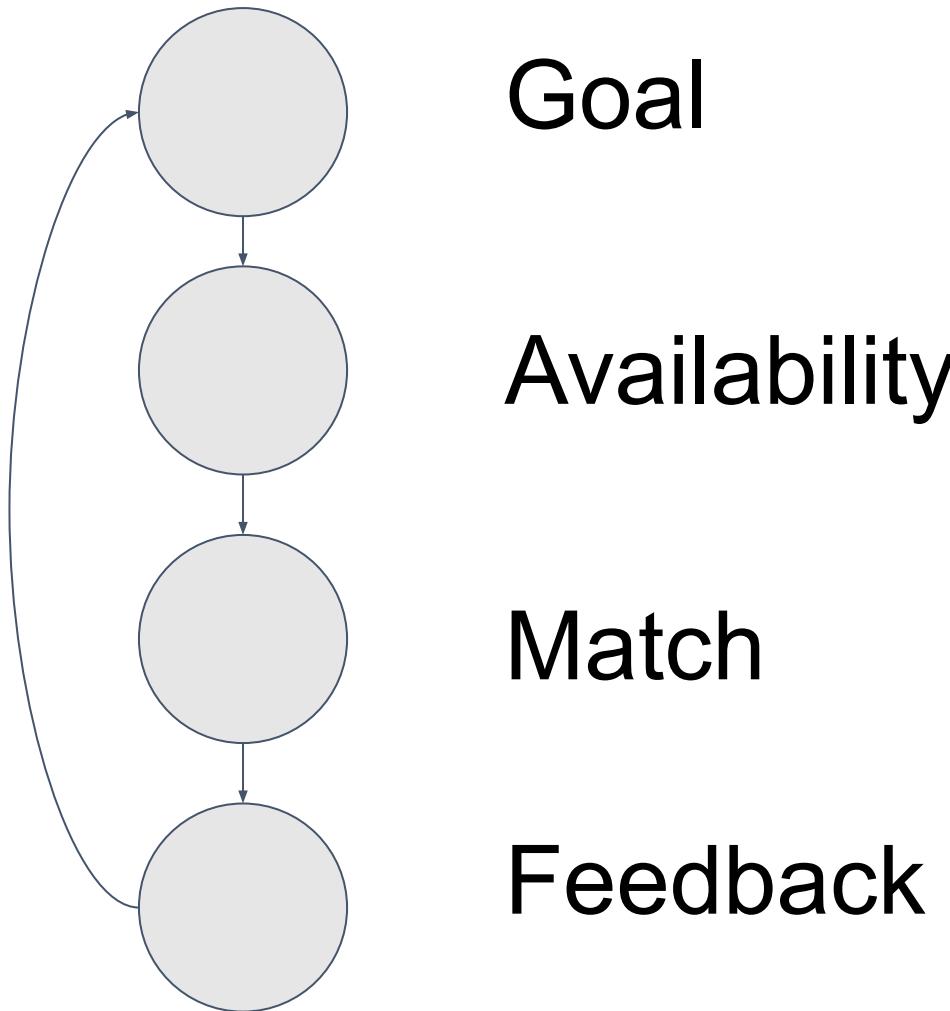

**Billing:**  
Estimated charges USD \$93.12  
For the billing period Jan 1 – 12, 2018

**Error Reporting:**  
No application errors in the last 24 hours

**News:**

- Stateful and ML workloads now run better on Google Kubernetes Engine with the latest version 1.9 (3 hours ago)
- Three ways to configure robust firewall rules (6 hours ago)
- Why you should pick strong consistency, whenever possible (1 day ago)

Why Google Cloud Platform?

# Example: Walkthrough of an API (demo)

# Example problem: Discovery

Goal

I want to delete a file

Availability

Type “File .” and auto complete gives

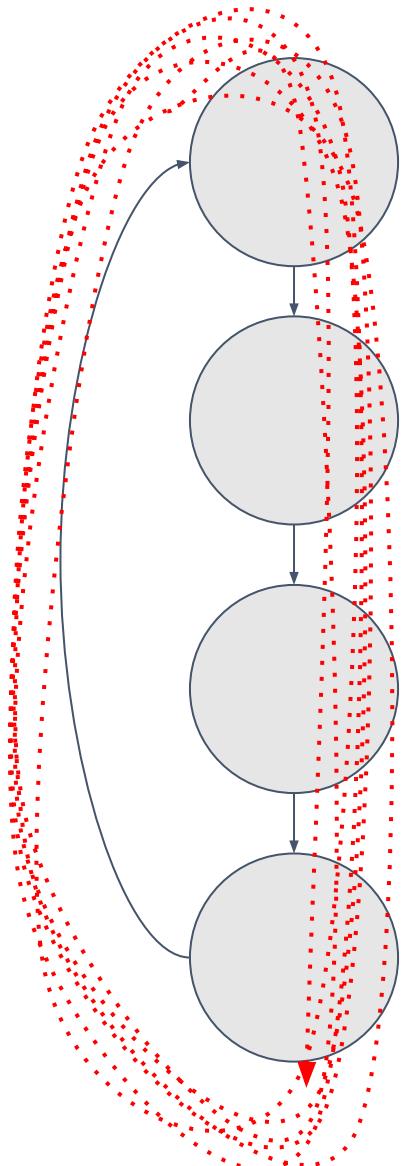

```
void main() {  
    File.  
}  
fromRawPath()  
fromUri()
```

Match

*There's a conceptual mismatch on whether file is a static method or you have to get a file and then delete it*

Feedback

# Example problem: ‘yak shaving’

Goal

To write a line to a file  
Open a file

Complete a future to get the file  
Convert a string to a bytebuffer  
Iterate over the bytebuffer  
Write the block

Complete on the future for writing  
Close the file  
Complete the future for closing the file

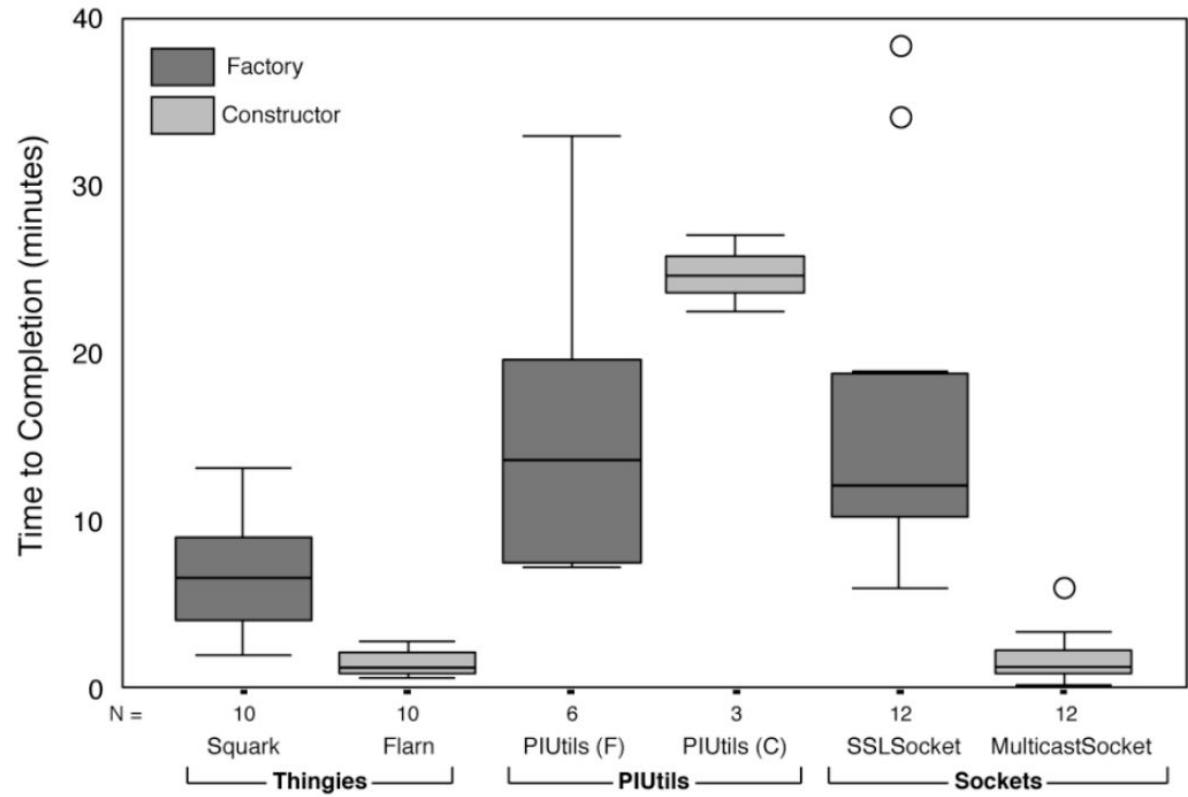

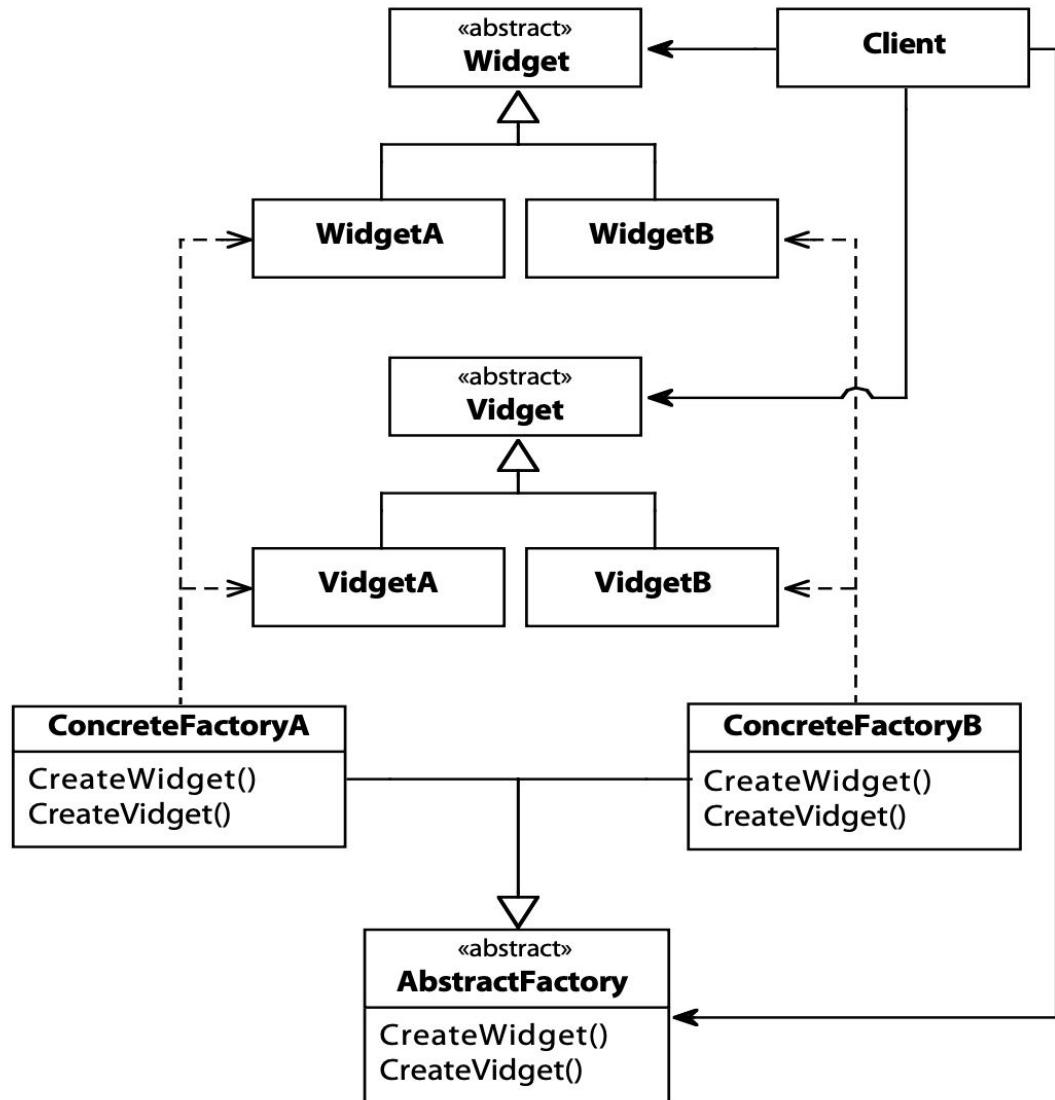

Availability

Match

Feedback

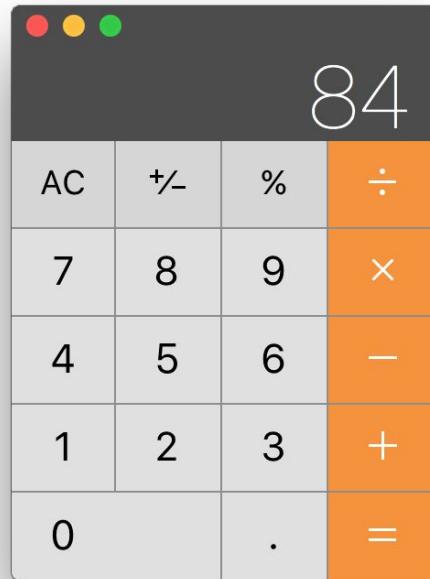

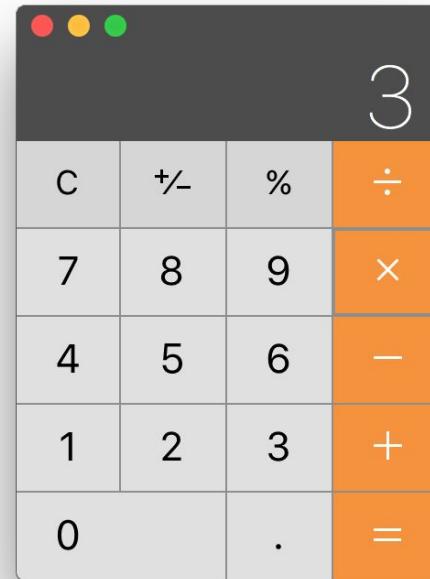

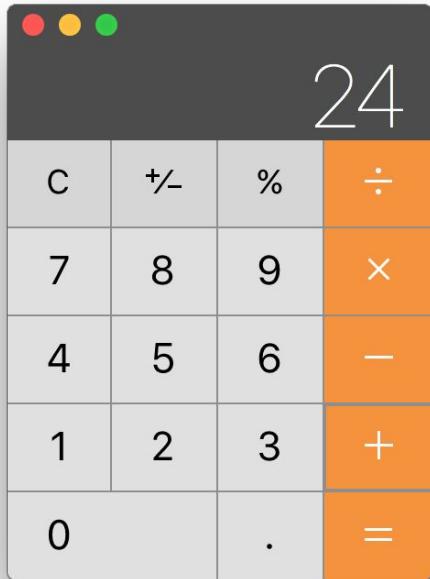

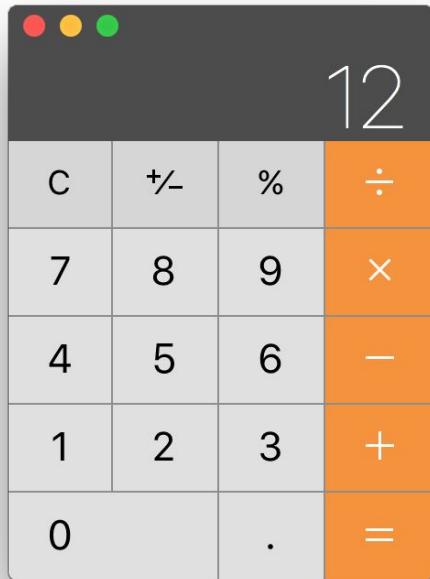

*Too many subgoals that need completing*

# Example (not-examinable)

**Figure 2. Time to Completion by Task**

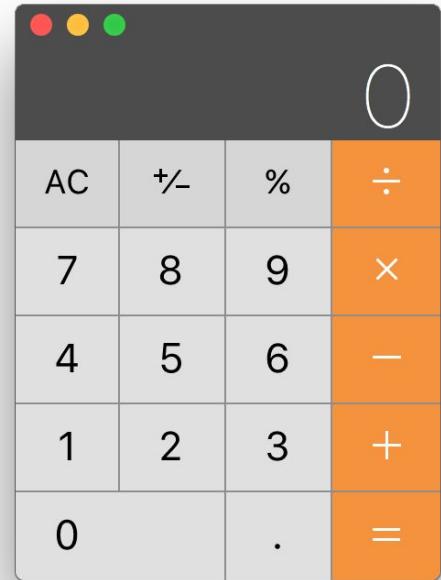

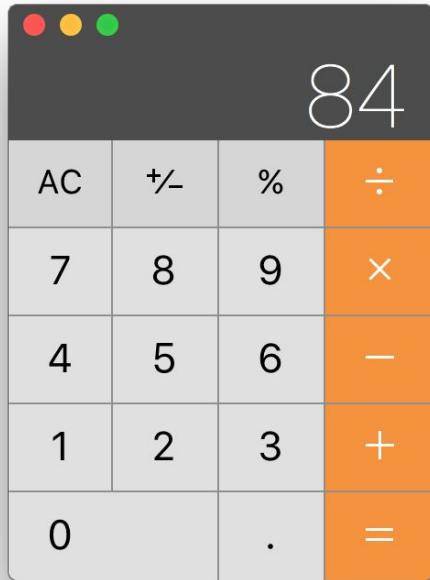

# **The cost of thinking: Heuristics and Biases**

AC

+

2

“eh?”

(Example from Richard Young)

How many times should the calculator user press AC?

# Classical theories of metareasoning

- Optimal search
  - Find the best possible solution within stated constraints on resources
- Bounded rationality
  - Computation is one of the constraints
- Satisficing
  - Find a satisfactory solution within computation constraints

# Neuro-economic models of reasoning

- Behavioural economics, sometimes applied as “nudge”
- Original basis in “prospect theory” (Kahneman & Tversky)
  - General theory of decision making
  - Construct a utility model, based on outcome of possible actions
  - Weight estimated values by likelihood
  - Choose action with optimal utility
  - May include future value discounting
- In practice, the optimisation is more likely to involve satisficing, due to reasoning with bounded rationality constraints
  - In Kahneman’s terms “thinking fast and slow”

# Bounded rationality in humans

- Apply *heuristics* rather than searching for optimal plan
  - Availability heuristic - reason based on examples easily to hand
  - Affect heuristic – base decision on emotion rather than calculating cost / benefit
  - Representativeness heuristic - judge probability based on resemblance
- Apply *biases* to ensure estimation error within tolerable bounds
  - Loss aversion - losses hurt more than gains feel good
  - Expectation bias - researchers (even in HCI) find results they expected
  - Bandwagon effect - do what other people do
- And many others!

# Behavioural economics in programming

- “Attention Investment theory” of abstraction use
  - Automation requires abstract specification
    - e.g. defining a regular expression for search and replace
  - Benefit of automation is saving time and concentration in future
  - But abstract specification (programming) takes time and concentration!
    - and more powerful abstractions (programs) can go wrong powerfully
  - User may *prefer* repetitive manual operations - safe and incremental
- So utility function will compare a) future saving of attention from programming vs b) costs of concentrating on a risky strategy
  - Biases such as loss aversion will apply
  - Bounded rationality will apply, since deciding what to do takes even more concentration

# **The limitations of goal based HCI**

# It assumes the user doesn't make mistakes

- Would need a cognitive model of why error occurred
  - Information loss due to cognitive limitations
  - Incorrect mental model
  - Misleading design
- Need description of user journey that accounts for problem identification, diagnosis, debugging, testing, iteration etc

# It assumes the user has the right goal

- Persuasive design is a field of HCI that addresses goal formation
- Applications:
  - Reduce energy consumption
  - Promote exercise
  - Manage diet and nutrition
  - Smoking cessation
- May include “nudge” to account for biases
  - But most people see this as paternalistic / patronising

# It assumes the user knows what the goal is

- Not true when the purpose is a cultural/aesthetic experience (third wave HCI) - what is my “goal” in listening to a piece of music?
- Not true in “exploratory design”

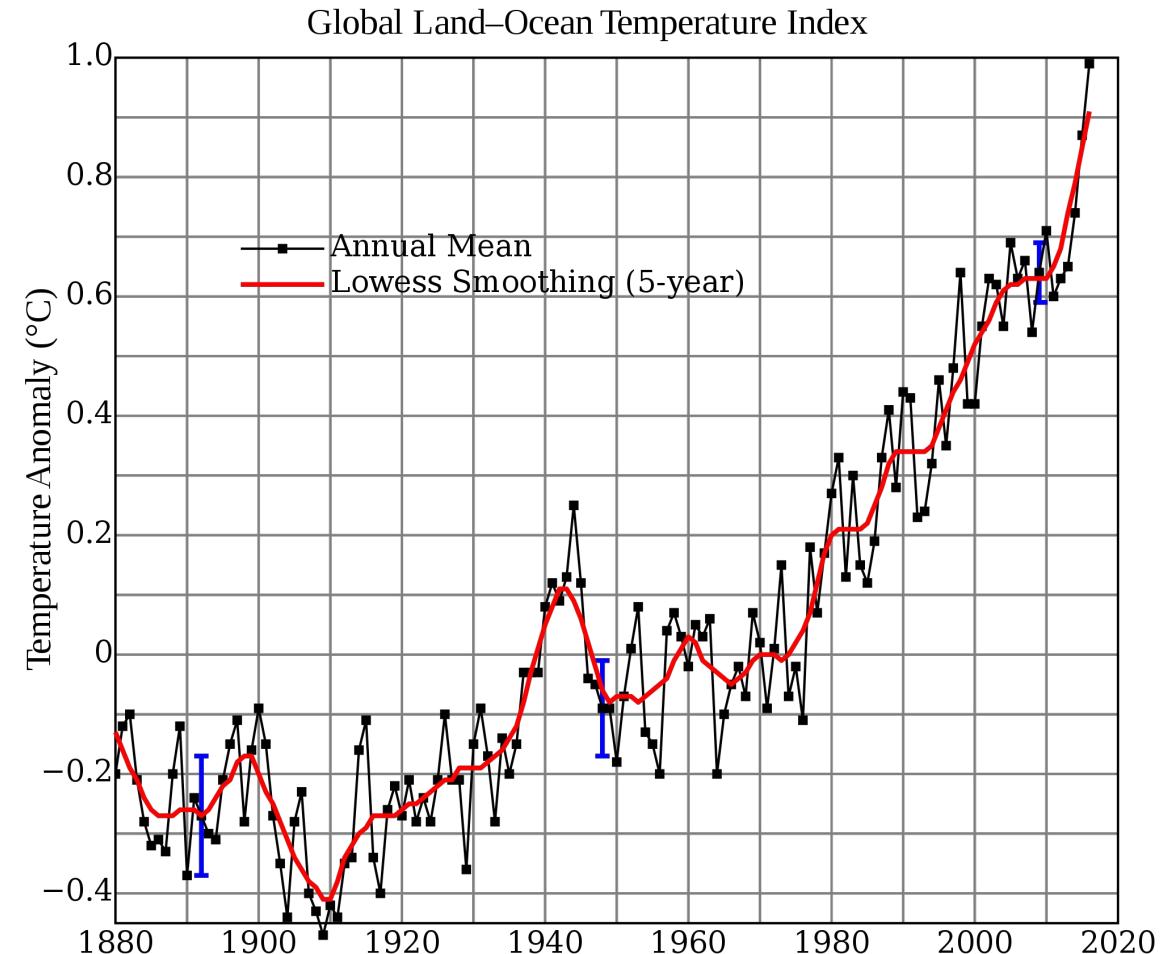

- More attention to this later in the course
- Some problems can’t be decomposed into actions
- Sometimes actions have side effects

# Wicked problems

Including material provided by  
Steven Tanimoto

# A Wicked Problem:

## Slowing climate change

# More Wicked Problems

- Stopping the spread of antibiotic-resistant diseases
- Halting nuclear proliferation
- Ending homelessness in Cambridge
- Avoiding species extinction
- Colonizing Mars

# Rittel-Webber Characteristics 1-5 of 10

1. **There is no definitive formulation of a wicked problem**
2. Wicked problems have no stopping rule
3. Solutions to wicked problems are not true-or-false, but good-or-bad
4. There is no immediate and **no ultimate test of a solution** to a wicked problem
5. Every solution to a wicked problem is a “one-shot operation”; because there is no opportunity to learn by trial-and-error, every attempt counts significantly

# Rittel-Webber Characteristics 6-10 of 10

6. Wicked problems do not have an enumerable (or an exhaustively describable) set of potential solutions, **nor is there a well-described set of permissible operations** that may be incorporated into the plan
7. Every wicked problem is essentially unique
8. Every wicked problem can be considered to be a symptom of another problem
9. The existence of a discrepancy representing a wicked problem can be explained in numerous ways. The choice of explanation determines the nature of the problem's resolution
10. **The planner has no right to be wrong**

# The programming analogy challenge 2026: Example #2: Outlook

- Think of an email as a message (duh) as in the asynchronous model of the original object-oriented language Smalltalk
- Later OO languages implemented this as synchronous methods and member functions
- The key question for system analysis is: what state change in the receiver object is allowed/necessary?
- Outlook already has a state model for calendar maintenance
- Could AI-assisted parsing facilitate other automated workflows?
- Should they offer type verification, assertions, side effects, visibility modifiers ...
