

2008 Paper 8 Question 13

Types

- (a) Explain what is meant by the relation of *specialisation*, $\sigma \succ \tau$, between Mini-ML type schemes σ and Mini-ML types τ . How is \succ used in the Mini-ML type system? [4 marks]

Assuming α_1 and α_2 are distinct type variables, which of the following are valid instances of specialisation?

(i) $\forall \alpha_1, \alpha_2 (\alpha_1 \rightarrow \alpha_2) \succ (\alpha_1 \rightarrow \alpha_1) \rightarrow \alpha_1$

(ii) $\forall \alpha_1 (\alpha_1 \rightarrow \alpha_2) \succ (\alpha_1 \rightarrow \alpha_1) \rightarrow \alpha_1$

(iii) $\forall \alpha_1 (\alpha_1 \rightarrow \alpha_2) \succ (\alpha_2 \rightarrow \alpha_2) \rightarrow \alpha_2$

(iv) $\forall \alpha_1 (\alpha_1 \rightarrow \alpha_1) \succ (\alpha_1 \rightarrow \alpha_1) \rightarrow \alpha_2$

[6 marks]

- (b) Extending Mini-ML with fixed-point expressions $\mathbf{fix} x(M)$, consider the following typing rules:

$$\text{(mono-fix)} \quad \frac{\Gamma, x : \forall\{\}\{\tau\} \vdash M : \tau}{\Gamma \vdash \mathbf{fix} x(M) : \tau} \quad \text{if } x \notin \text{dom}(\Gamma)$$

$$\text{(poly-fix)} \quad \frac{\Gamma, x : \forall A(\tau) \vdash M : \tau}{\Gamma \vdash \mathbf{fix} x(M) : \tau} \quad \text{if } x \notin \text{dom}(\Gamma) \text{ and } A = \text{ftv}(\tau) - \text{ftv}(\Gamma)$$

(where as usual $\text{ftv}(-)$ indicates the set of free type variables in $-$). Write $\Gamma \vdash_{\text{mono}} M : \tau$ (respectively $\Gamma \vdash_{\text{poly}} M : \tau$) if $\Gamma \vdash M : \tau$ is provable in the Mini-ML type system extended with the rule (mono-fix) (respectively with the rule (poly-fix)). Let $M = \mathbf{fix} x(\lambda y((x x)y))$. State, with justification, which of the following hold for some type τ .

(i) $\{\} \vdash_{\text{mono}} M : \tau$

(ii) $\{\} \vdash_{\text{poly}} M : \tau$

[10 marks]
