

10 Algorithms (TMS)

- (a) State the Max-Flow Min-Cut Theorem. [2 marks]
- (b) For an arbitrary integer $k \geq 1$, give an example of a flow network with at most five vertices on which the basic Ford-Fulkerson method takes at least k steps to terminate. [4 marks]
- (c) Consider the following flow network G :

Given an initial flow f with $f(s, u) = f(u, w) = f(w, t) = 2$, perform one iteration of Ford-Fulkerson; that is, draw the residual graph G_f , specify an augmenting path in G_f , and update the flow f . Is this new flow a maximum flow? Justify your answer. [5 marks]

- (d) Given an undirected, connected graph $G = (V, E)$, the edge-connectivity of G is the *size* of a smallest set of edges $X \subseteq E$ so that the graph $G' = (V, E \setminus X)$ becomes disconnected.
- (i) Describe an algorithm that computes the edge-connectivity of G , and analyse its runtime and correctness. [7 marks]
- (ii) Extend your algorithm so that it also returns a set X satisfying the conditions above. [2 marks]
