

8 Algorithms (FMS)

- (a) Explain the greedy strategy in algorithm design. To what problems does it apply? [3 marks]
- (b) If a problem can be solved with both dynamic programming and a greedy algorithm, what are the advantages of using one or the other? [2 marks]
- (c) An imaginary post office machine must issue decorative stamps adding up to a given amount of  $p$  pence. Its goal is to minimize the number of postage stamps issued, and the machine always has as many stamps as needed.
- (i) Let the set of available denominations for the stamps be  $D = \{1\text{p}, 5\text{p}, 25\text{p}, 50\text{p}, \text{£}1, \text{£}2\}$ . Can this problem be solved using bottom-up dynamic programming? If so, clearly describe your algorithm and determine its complexity. If not, prove that it cannot be done. [5 marks]
- (ii) Let  $c_1 < c_2 < \dots < c_n$  be  $n$  stamp denominations. Prove that if each  $c_i$  (a positive integer) is a multiple of  $c_{i-1}$  for every  $i = 2, \dots, n$  then the greedy strategy applied to the set  $D = \{c_1, c_2, \dots, c_n\}$  finds the optimal solution for any amount  $p$  that is a multiple of  $c_1$ . [7 marks]
- (iii) Provide a set of denominations for stamps  $D$  and an amount of pence  $p$  for which the greedy strategy fails to give an optimal solution,  $p$  being a multiple of the smallest denomination in  $D$ . Show what solution the greedy strategy would find and what the optimal solution is. [3 marks]
