

8 Hoare Logic and Model Checking (jp622)

We consider the LTL temporal logic over atomic propositions $p \in \text{AP}$:

$\phi \in \text{PathProp} ::= p \mid \neg\phi \mid \phi_1 \wedge \phi_2 \mid \phi_1 \vee \phi_2 \mid \phi_1 \rightarrow \phi_2 \mid \mathbf{X} \phi \mid \mathbf{F} \phi \mid \mathbf{G} \phi \mid \phi_1 \mathbf{U} \phi_2$.

(a) Precisely state the semantics of the until operator $\phi_1 \mathbf{U} \phi_2$. [2 marks]

(b) Express $\mathbf{F} \phi$ in terms of the until operator – $\mathbf{U} =$. [2 marks]

(c) Give models $\mathcal{M}_1, \mathcal{M}_2$ such that $\mathcal{M}_1 \models \mathbf{G} (p \vee q)$ and $\mathcal{M}_2 \models (\mathbf{G} p) \vee (\mathbf{G} q)$, but either $\mathcal{M}_1 \not\models (\mathbf{G} p) \vee (\mathbf{G} q)$ or $\mathcal{M}_2 \not\models \mathbf{G} (p \vee q)$ (indicate which). [3 marks]

(d) Starting from any strictly positive integer n , the transition system induced by going to $n/2$ if n is even, and to $3 \times n + 1$ if n is odd, is conjectured to always pass through 1.

(i) Precisely describe this conjecture in the form of a model and an LTL formula. [4 marks]

(ii) Describe what shape a counterexample to this conjecture would have. [2 marks]

(e) Alice (a) and Bob (b) share a bicycle. To ensure they do not have problems, they have a protocol: they can express an interest for it (e), use it (u), or not need it (n), yielding atomic propositions $AP = \text{Pers} \times \text{Act}$, where $\text{Pers} ::= \mathbf{a} \mid \mathbf{b}$ and $\text{Act} ::= \mathbf{e} \mid \mathbf{u} \mid \mathbf{n}$, so that for example a state labelled with $\{\mathbf{ae}, \mathbf{bu}\}$ is one where Alice has expressed interest in using the bike, and Bob has taken it.

Give LTL formulas for

(i) Alice does not keep the bike forever. [2 marks]

(ii) Non-starvation: if Alice expresses an interest in having the bike for long enough, she eventually gets it. [2 marks]

(iii) Alice cannot take the bike twice in a row if Bob expresses interest throughout. [3 marks]
