

4 Formal Models of Language (pjb48)

- (a) The following is a pattern for some legal strings in a language:

$$[a \in A]\{0,1\} [b \in B]\{0,1\} [c \in C]\{1,n\} [d \in D]\{1,1\}$$

where A is a finite set of characters from the alphabet, Σ ; similarly for B, C, D . The sets A, B, C and D are disjoint. $\{x, y\}$ indicates that the previous bracket must match at least x times but no more than y times.

- (i) Specify a Deterministic Finite Automaton, M_1 , that can recognise these strings only. [4 marks]
- (ii) Design a Regular Grammar, G_1 , which generates $L(M_1)$. [4 marks]
- (iii) Describe a set of strings in a natural language that could be generated by G_1 given an appropriate Σ and its subsets A, B, C and D . [1 mark]
- (b) We can hypothesise that matches of the following pattern are always valid constructions in English:

$$[\text{The } Noun]\{n,n\} [Verb]\{n,n\}$$

where $Noun$ represents the coordinated members of a finite set; similarly for $Verb$.

- (i) Now consider the following English sentence which matches the pattern when $n = 1$:

The vaccine worked

Provide example sentences that extend this sentence for the case when $n = 2$ and $n = 3$. [2 marks]

- (ii) Assuming that these constructions are part of the English language, would this mean that English is a Context-Free Language? Justify your answer. [3 marks]
- (iii) Design a grammar in Chomsky Normal Form, G_2 , which generates the finite matches of the pattern. [3 marks]
- (iv) Specify a Push Down Automaton, M_2 , that recognises $L(G_2)$. [3 marks]
