### 17. On regular languages

1. Why can't the automaton  $Star(M)$  used in [step \(iv\)](#) of the proof of part (a) of Kleene's Theorem be constructed by simply taking  $M$ , making its start state the only accepting state and adding new  $\epsilon$ -transitions back from each old accepting state to its start state?
2. Construct an NFA <sup>$\epsilon$</sup>   $M$  satisfying  $L(M) = L((\epsilon|b)^*aab^*)$  using Kleene's construction.
3. Show that any finite set of strings is a regular language.
4. Use the construction given in the proof of part (b) of Kleene's Theorem to find a regular expression for the DFA  $M$  whose state set is  $\{0, 1, 2\}$ , whose start state is 0, whose only accepting state is 2, whose alphabet of input symbols is  $\{a, b\}$ , and whose next-state function is given by the following table.

$\delta$	$a$	$b$
0	1	2
1	2	1
2	2	1

5. If  $M = (Q, \Sigma, \Delta, s, F)$  is an NFA, let  $Not(M)$  be the NFA  $(Q, \Sigma, \Delta, s, Q \setminus F)$  obtained from  $M$  by interchanging the role of accepting and nonaccepting states. Give an example of an alphabet  $\Sigma$  and an NFA  $M$  with set of input symbols  $\Sigma$  such that  $\{u \in \Sigma^* \mid u \notin L(M)\}$  is *not* the same as  $L(Not(M))$ .
6. Let  $r = (a|b)^*ab(a|b)^*$ . Find a regular expression that is equivalent to the complement for  $r$  over the alphabet  $\{a, b\}$  with the property  $L(\sim r) = \{u \in \{a, b\}^* \mid u \notin L(r)\}$ .
7. Given DFAs  $M_i = (Q_i, \Sigma, \delta_i, s_i, F_i)$  for  $i = 1, 2$ , let  $And(M_1, M_2)$  be the DFA

$$(Q_1 \times Q_2, \Sigma, \delta, (s_1, s_2), F_1 \times F_2)$$

where  $\delta: (Q_1 \times Q_2) \times \Sigma \rightarrow (Q_1 \times Q_2)$  is given by

$$\delta((q_1, q_2), a) = (\delta_1(q_1, a), \delta_2(q_2, a))$$

for all  $q_1 \in Q_1, q_2 \in Q_2$  and  $a \in \Sigma$ . Show that  $L(And(M_1, M_2)) = L(M_1) \cap L(M_2)$ .

### 18. On the Pumping Lemma

1. Briefly summarise the proof of the Pumping Lemma in your own words.
2. Consider the language  $L \triangleq \{c^m a^n b^n \mid m \geq 1 \wedge n \geq 0\} \cup \{a^m b^n \mid m, n \geq 0\}$ . The notes show that  $L$  has the pumping lemma property. Show that there is no DFA  $M$  which accepts  $L$ .

*Hint:* argue by contradiction. If there were such an  $M$ , consider the DFA  $M'$  with the same states

as  $M$ , with alphabet of input symbols just consisting of  $a$  and  $b$ , with transitions all those of  $M$  which are labelled by  $a$  or  $b$ , with start state  $\delta_M(s_M, c)$  where  $s_M$  is the start state of  $M$ , and with the same accepting states as  $M$ . Show that the language accepted by  $M'$  has to be  $\{a^n b^n \mid n \geq 0\}$  and deduce that no such  $M$  can exist.
