Information-Centric Networking

Seeing the Forest for the Trees

Structure of the Talk

- Background
- Commonalities of Designs
- Differences in Design
- Directions for research
- Conclusion

Background

- Surge of interest in ICN
- Literature difficult to absorb
- Aim is to give a broader view on ICN design
- Key point of the paper: the need for architectural research

Commonalities of Design

- Basic Primitives
- Universal Caching
- Content-oriented Security Model

Fundamental Differences in the Design

Naming

Hierarchical human-readable vs self-certifying

Interdomain Name-Based routing

On top of BGP vs separate named based routing

Narrow waist

Retain IP vs replace IP

Directions for research: Topics that deserve small attention

- Required ICN Mechanisms
- HTTP can be turned into an ICN design

Directions for research: ICN design (1/2)

- Privacy:
 - Content requested available to ICN nodes
- Interdomain Policies

Directions for research: ICN design (2/2)

- Scalable routing:
 - Should handle 10¹² objects

Done at packet speed

Routing table <10⁸ entries

Content objects larger than requests

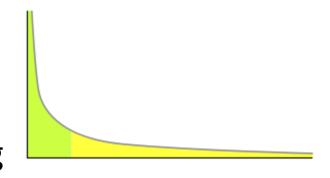

Aggregation through hierarchical names

Request patterns result in small working set

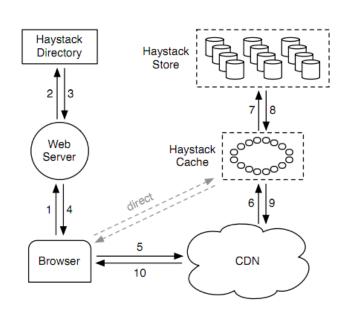

Directions for research: The performance gain of ICNs

- Empirical evidence
 - The fail of cooperative caching
 - The long tail of Content-Sharing
 Networks
 - Facebook image caching

 Efficiency of caches in the long tail

Zipf Distribution

Conclusion

- Two fundamental questions:
 - What benefits do ICN designs offer?
 - Are ICN designs the best way to achieve those benefits?
- About the paper:
 - Asks the right questions
 - Does not always answer them objectively
